1. Introduction

With its wide distribution, precarious conservation status, and immense aesthetic appeal, the snow leopard is considered the flagship species of the high altitudes and an indicator species for Asia's high mountain ecosystems. Snow leopard habitat is spread through the northern Himalayan mountains of Jammu and Kashmir, Himachal Pradesh, Uttarakhand and in western Himalayan region of Sikkim and Arunachal Pradesh in India (India NSLEP). In spite of all the ecological, social and cultural richness, Himalayas have not received the required attention to conserve and maintain its environment. The reasons may be lack of knowledge about the region and remoteness. Now, it's imperative that conservation measures should be in place to protect the ecological treasure and indigenous tribal communities. One such step taken by the Government to conserve and manage the high-altitudes is the Project Snow Leopard (PSL), developed specifically to strengthen conservation in these areas.

The Project Snow Leopard is an Indian initiative for strengthening wildlife conservation in the Himalayan high altitudes. It aims to promote a knowledge-based and adaptive conservation framework that fully involves the local communities, who share the snow leopard's range, in conservation efforts. (Project Snow Leopard)

The goal of Project Snow Leopard is *to safeguard and conserve India's unique natural heritage of high-altitude wildlife populations and their habitats by promoting conservation through participatory policies and actions.* (Project Snow Leopard)

Given that this high-altitude landscape is unique as the wildlife populations, though threatened, occur across the landscape and are not restricted to protected areas, an alternative, landscape-level conservation approach is needed. At the same time, this landscape continues to undergo traditional resource use in the form of livestock grazing and associated activities, and a participatory approach to conservation, that fully involves local communities, is urgently required.

SECURE Himalaya is the next step towards the conservation and management of the landscape. The project will be implemented integrating all relevant sectors that link different land uses with livelihood development sectors to ensure sustainable development of natural resources and the local communities. The project is intended to build on the existing socio-economic and natural resources developmental initiatives currently underway in the region and would aim for evolving innovative and participatory models for sustainable use of natural resources. It aims to achieve the objective of conservation by engaging local communities and collaborating with government and non-government agencies for conservation and promotion of sustainable resource use for improved livelihoods.

Furthermore, GIPL-UNDP Project aims at the development of an integrated strategy for conservation of snow leopard, other endangered species along with other biodiversity while

focusing on the improvement of socio-economic aspects of the areas through a landscape level participatory integrated approach in the ***Lahaul- Pangl Landscape and Kinnaur Landscape, Himachal Pradesh.***

Many important endemic floral and faunal species are found naturally occurring in this region, which besides supporting the livelihoods of the local communities, also have national and global demands in legal and illegal commerce.

In many high altitudinal areas, the threat to snow leopards, wild prey and their ecosystems face a variety of direct and indirect threats that vary in intensity and prominence. Habitat degradation and fragmentation is increasing due to unsustainable livestock grazing, high dependence of local communities on natural resources, pressures from economic and infrastructure development (unplanned development), selective removal of medicinal and aromatic plants, emerging threat of illegal wildlife trade and wildlife crime and climate change (Ning et al. 2013; Mishra et al. 2010). All these challenges demand evolution of a strategy that integrates actions of different sectors and stakeholders to converge the interventions that promote sustainable use, and conservation and improvement of the natural ecosystems, enhance the livelihood options available to the local communities, improve their health, education and skills, create renewable energy sources at local level, increase their stakeholder ship in local biodiversity, e.g., through active involvement in ecotourism activities, value addition and marketing of NWFP and medicinal herbs, etc.

The project will be implemented integrating all relevant sectors that link different land uses with livelihood development sectors to ensure sustainable development of natural resources and the local communities. The project is intended to build on the existing socio-economic and natural resources developmental initiatives currently underway in the region and would aim for evolving innovative and participatory models for sustainable use of natural resources. It aims to achieve the objective of conservation by engaging local communities and collaborating with government and non-government agencies for conservation and promotion of sustainable resource use for improved livelihoods.

The present management document is an effort to apply the principles of Project Snow Leopard and SECURE Himalaya. This management plan has been developed to conserve the Lahaul-Pangl landscape with the rich ecological, cultural and social diversity.

2. Methodology and analysis

a. Broad Methodology

The methodology adopted undertaking the relevant objective in the assignment broadly involved following steps:

- Desktop Research and Literature review
- Stakeholder Engagement and Focus Group Discussion and Consultations and landscape level workshops
- Site Selection, Field visits and Data Collection
- Data Analysis
- Report Development and Final Report Submission

The methodology and approach encompass a combination of above activities that would comprise desk study, collections of existing information from relevant and related line departments, identifying visit sites and prioritizing stakeholders, especially women from local communities, conducting small and focus discussion through “culturally appropriate” mechanisms, local and state level workshops, selected need-based informed interviews and surveys. Innovative tools developed by ICIMOD for the purpose e.g. selected shorter landscape journeys with selected stakeholders were also used to enhance the quality and coverage of the interaction.

Strategy was to involve the government departments, NGOs, industries, Universities, Research Organization, experts and every other stakeholder related to the SECURE Himalaya to bring at a common ground and then create a platform for convergence. The Stakeholders list have been attached in the Annexure-3

The deliverables were divided in the form of Work Packages for better tracking of the progress of the project:

| Component | Approach and Methodology | Work Done |
|--|--|---|
| WP-1 Assessment of Historic Trends, strengths and weaknesses and community perception | <ul style="list-style-type: none"> Primary data collection <p>Questionnaire based survey (Annexure-1) and focused group discussion (Annexure-5 and 6)</p> <ul style="list-style-type: none"> Secondary data collection <p>Desk research (census, gazetteers, Government documents, annual reports, etc.)</p> | <p>400 no. of questionnaires were collected from 9 villages in Lahaul-Pangi</p> <p>Review of Research Papers have been shared in the Annexure-2</p> |
| WP-2 Gap analysis of current management plans, schemes and strategies of landscape, its shortcomings and level of integration between all | <ul style="list-style-type: none"> Desk Research Tool: SWOT Analysis Inputs from various core experts- Dr. Ruchi Badola (local communities, livelihoods, gender), Dr. Abhimanyu Mann (wildlife crime, involvement of LCs) and Dr. S K Dhyani (agroforestry, sustainable land use, livelihoods) | <p>Policy Gap analysis sheet have been attached in the Annexure-4</p> |
| <p>A. Primary Information Collection</p> <p>B. Two Stakeholder Workshop Reports along with vision and objectives of Landscapes</p> | <p>A. Questionnaire based field survey</p> <p>B. Stakeholder mapping</p> <p>Tools: Power-Interest Matrix</p> | <p>The Proceedings of the Workshops have been attached as Annexure-5 and 6</p> |

| | | |
|---|---|--|
| Baseline Data and Monitoring Indicators | This was done by defining baseline, midterm and end term targets keeping in mind the timeline of SECURE | |
| Final Report | Based on all the inputs received from the above | |

Primary Data Collection

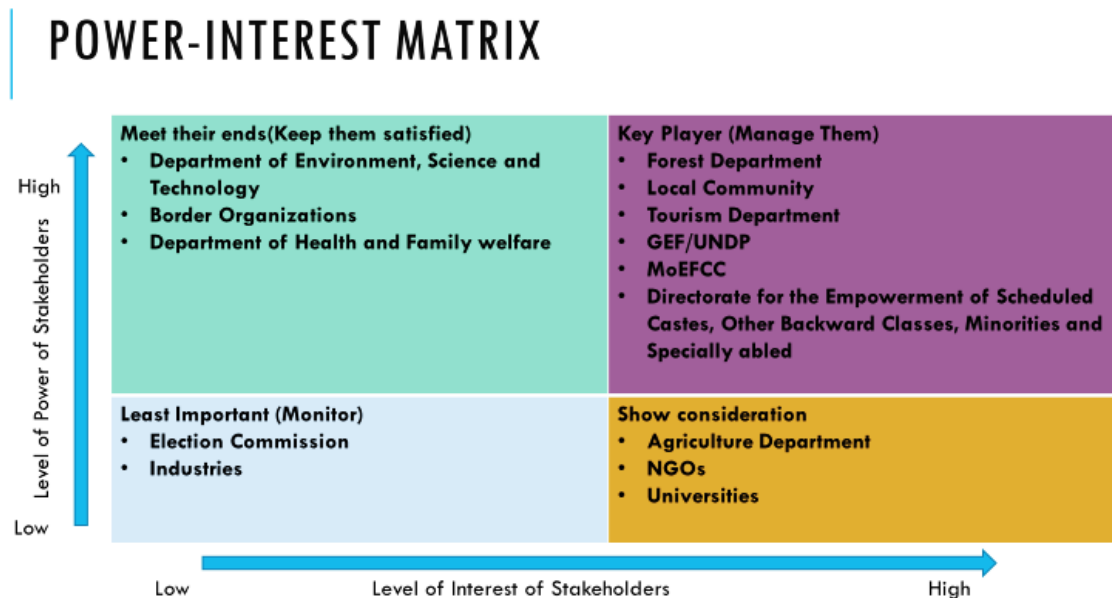

Methodology:

1. **Villages-** Villages list approved by the State Level Technical Committee, the list for which was shared by UNDP. There were 35 villages from Lahaul-Pangi
2. **Households-** Household data collected from Census 2011 and respective GPUs.
3. **Sampling-** Stratified random sampling for households (maximum 30% of the total households)

Note: Random sampling has been adopted in order to cover all social strata of particular village

4. **Focused Group Discussion-** Adequate representation from all social classes and gender ensured. There is agenda of the FGD where discussion takes place according to details of the agenda. The pointers of the FGDs are discussed thoroughly with one person duly noting the minutes.

5. **Small meetings-** With various stakeholders. There is no agenda, only open-ended discussion takes place. Personal interviews were conducted through paper and pencil interview type (PAPI), Face to face interview (CAPI) or telephonic interview (as required) with government officials, domain experts, local leaders, etc. The various categories of stakeholder included Government departments, Institutions, Non-Government Organizations (NGOs), Agencies, Individual experts. Identification of key stakeholder was

Stakeholders with high power but low interest shall be kept satisfied, while those with low interest and low power can be just monitored for their activities. Stakeholders with high interest in project and high power shall be closely managed and involved to the best possible extent. Lastly, stakeholder with low power and high interest in project will be regularly engaged, informed and appropriate action initiated to empower them. Some of the methods that will be used to consult stakeholders after prioritization include:

- Information Centre and Information Boards
- Communication by phone, email, text and instant messaging
- Distribution of pamphlets and response to questionnaire (Format of Questionnaires appended as Annexure-1)
- One-on-one interviews
- Formal meetings
- Public meetings
- Workshops
- Focus group meetings
- Surveys

For deciding the frequency and the appropriate engagement technique to consult a stakeholder group, we will consider three criteria as listed below:

- The extent of impact of the project on the stakeholder group.
- The extent of influence of the stakeholder group on the project design/focus.
- The culturally acceptable engagement and information dissemination methods.

Stakeholder Consultation Workshops

Two stakeholder workshops were organized in the landscape. First workshop was conducted in Shimla to ensure the participation of every State Line Department. The second workshop was conducted in the landscape village, Killar, Pangi. The Mandate of the workshops were to evaluate the Draft Management Strategy prepared after the primary data collection and secondary Data review. It was kept in mind to keep the adequate gender representation at each with presence of all key stakeholders. The Proceedings of these workshops have been attached in the Annexure- 5 and 6.

3. Extent of landscape

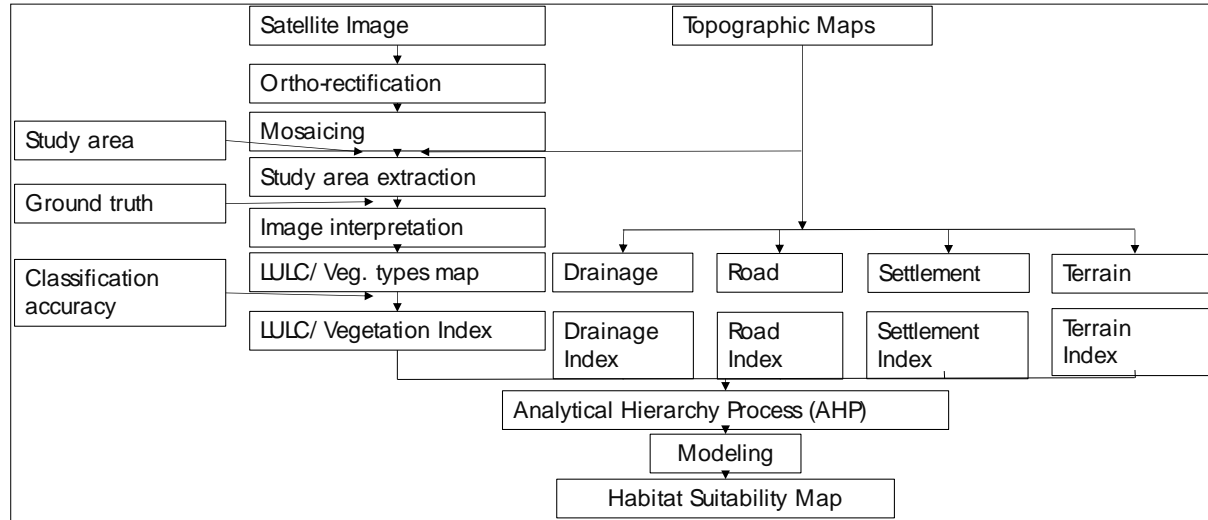

Habitat suitability modelling for Snow leopard in Himachal Pradesh

Methods

In this study we used combination of GIS and multi-criteria decision making (MCDM) model was used to obtain the habitat suitability of snow leopard. The methodology flowchart is shown in Figure 1.

Model variables

We selected the predictor variables considering their applicability to the scale of our study area, relevant predictive capacity, and their association with the ecological requirements of the selected species. We classified the selected variables into following four thematic classes viz., a) habitat composition, b) anthropogenic disturbance, c) topography and d) distance to water courses. We used vegetation and land use map prepared by the Biodiversity characterization project for Sikkim state using IRS satellite data of year 2013-14. We calculated Euclidian distance for proximity to settlements and roads/ trails, which represents the impact of anthropogenic drivers. Additionally, under topography we selected altitude, slope, and aspect that can potentially affect the movement of the species.

Habitat Quality Rating

Digital database of vegetation type/ land use, drainage network, settlement, road network, elevation, slope and aspect was prepared in GIS environment. Four categories of each thematic layers i.e. vegetation types/land uses, terrain complexity (elevation, slope and aspect), drainage, road network and settlements were rated into habitat values by assigning habitat quality rating (HQR) based on their suitability on a scale of 1–4 in descending order of suitability (for instance value 1 was assigned to highly suitable habitat while 4 to unsuitable

habitat). We created buffer maps using Euclidean Distance tool in ArcMAP for drainage, roads/ trails and settlements. Once all thematic layers were classified into four suitability classes, a linear additive model was run to model habitat suitability of Snow Leopard, in Sikkim state. Weights assigned to different layers were derived using Analytical Hierarchy Process (AHP). AHP is a pair-wise comparison procedure of the criteria that is based on a square matrix in which the number of rows and columns is defined by the number of criteria to weigh. In this study, the criteria weights were obtained using the AHP and employed in the GIS based MCDM model.

Linear additive model: $0.491 \times VTI_{sl} + 0.287 \times TI_{sl} + 0.128 \times DI_{sl} + 0.062 \times RI_{sl} + 0.033 \times SI_{sl}$ (CR: 0.081)

where,

HSI = Habitat Suitability Index,

VTI = Vegetation Type Index,

TI = Terrain Index

DI = Drainage Index,

RI = Road Index,

SI = Settlement Index

CR = Consistency Ratio

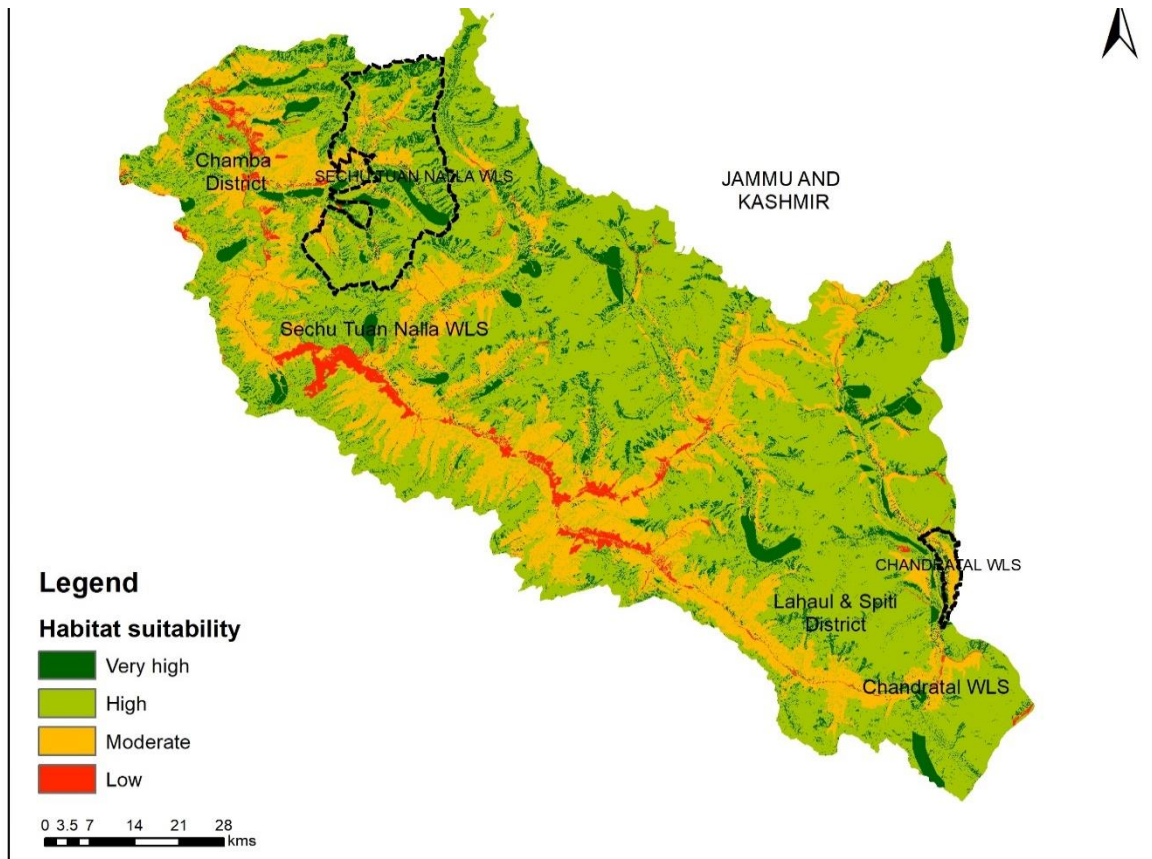

Accuracy of linear additive models for habitat suitability index of each species were evaluated by observing consistency ration (CR) value following Saaty's principle, where CR ratings lesser than 0.10 could be further used in the study, while ratings >0.10 should be re-evaluated. In this study, the consistency ratio was 0.081, which means the results were acceptable.

Table 1: Suitability class and Habitat Quality Rating (HQR)

| Suitability Class | HQR |
|---------------------|-----|
| Highly suitable | 1 |
| Suitable | 2 |
| Moderately suitable | 3 |
| Least suitable | 4 |

Table 2: Vegetation Type/Land Use type wise Habitat Quality Rating (HQR)

| Sr. No. | Class | HQR |
|---------|---|-----|
| 1 | Alpine Moist Meadows | 1 |
| 2 | Alpine Dry Scrub | 2 |
| 3 | Alpine Moist Scrub | 2 |
| 4 | Montane Broadleaved (Deciduous) Forests | 3 |
| 5 | Subalpine Forests | 3 |
| 6 | Montane Needle leaved Forests | 3 |
| 7 | Tropical broadleaved forest | 4 |
| 8 | Sub-Tropical broadleaved forest | 4 |
| 9 | Sub-Tropical needle leaved forest | 4 |
| 10 | Montane Broadleaved Evergreen Forests | 4 |
| 11 | Secondary scrub | 4 |
| 12 | Montane grassland | 2 |
| 13 | Subalpine scrub | 2 |
| 14 | Alpine steppe | 1 |
| 15 | Snow and glaciers | 1 |
| 16 | Agriculture | 4 |
| 17 | Habitation | 4 |
| 18 | Waterbody | 4 |
| 19 | Rock/barren land | 1 |

4. Landscape profile, threats (trends & drivers of change) and gaps in conservation of snow leopard habitats

Background information and attributes of the landscape

Himachal Pradesh located between 30°22' and 30°12' north latitude and between 75°47' and 79°4' east longitude is a hilly state where the Himalaya is demarcated into various ranges like Outer Himalaya with Shivalik range, the Lesser Himalaya with Dhauladhar range, the Great Himalaya with Pir Panjal range and the Trans Himalaya with Zaskar range. It is characterized by an uneven elevation, which ranges from 350 meters to 7000 meters above sea level. Himachal Pradesh sharing its borders with Jammu and Kashmir in the north, Punjab in the west and south-west, Uttar Pradesh and Haryana in the south, Uttarakhand on south-east and Tibet on the east, spread across an area of 55,673 sq km occupying nearly 10.54% of the Himalayan land mass. The state has great climatic variations, ranging from hot and sub-humid tropical to cold glacial and alpine. The state has 63.9% percent of its area under forest cover. The forests are mainly of three types viz., Tropical Forests - confined to foothills with scrub of *Acacia* and *Zizyphus* and dry deciduous forests of Sal; Sub tropical forests from elevation of 500-1800m (subtropical evergreen forests below 1200m dominated with species of *Albizia*, *Terminalia* etc. and subtropical forests of Pine upto 1800 m.) and Temperate forests - from 1800m to 3000 m with trees of oaks, deodar, blue pine, horse chestnut, holm oak and edible pine. Himachal Pradesh is known for the natural beauty of its forests, rivers, valleys, hills and has a rich flora and a wide variety of wildlife.

The high-altitude Himalaya is rich in endemic plants (Bahar,2002). The increasing potential threat to biological diversity is an irreversible environment disorder that warrant immediate remedial measures for sustainable conservation of biodiversity. It is believed that the excessive anthropogenic activities are the main cause of decline in population and availability of medicinal and aromatic plants in the Himalayan region (Dhyani and Kala, 2005; Samant *et al.*, 1998; Samant *et al.*, 2000; Samant *et al.*, 2001). The fast pace of tourism in high altitudinal areas are another important factor causing the damage of bio-diverse ecological system (Blangy and Mehta, 2006).

Himalaya is one of the mega biodiversity regions of world (Myers *et al.*, 2000). The north western Himalaya consist unique habitats to sustain several endemic and rare plant taxa. The vegetation comprises evergreen forests with pure stands of *Pinus roxburghii*, *Pinus wallichiana*, *Quercus* spp., *Cedrus deodara*, *Abies pindrow*, *Picea smithiana*, *Taxus wallichiana* and *Juniperus* spp. in dry temperate and alpine regions representing various species composition make the valleys rich in Phyto diversity.

Himachal Pradesh:

According to population census of India 2011, Himachal Pradesh has a population of 6,864,602 with a decadal growth of 12.94%. 8.1% of the total population lives below poverty line. The state has 1,424,950 lakhs as Gross state value added (GSVA) from agriculture and allied sector at constant for the year of 2017-18 (Agriculture Census, 2015-16).

Number and area of operational holdings (Agriculture Census, 2015-16).

Lahaul-Pangi Landscape:

Both the subdivisions are governed through a mechanism called the 'single-line administration' whereby all departments functioning there directly work under the Additional District Commissioner (ADC), who is aided by a Sub Divisional Magistrate (SDM) and Tehsildar. This system was necessitated to streamline administration due to the poor connectivity and communication with the state capital of Shimla.

Lahaul-Pangi Landscape combined has a total area of 8237.78 sq.km., which includes Pangti subdivision of Chamba and Lahaul and Udaipur subdivision of Lahaul-Spiti. The landscape region has two Protected Areas, Seichu Tuan Nalla WLS (390 sq. km.) and Chandratat WLS (38.56 sq. km.).

Lahaul:

The Lahaul valley lies between 31°44'57" and 32°59'57"N latitude and 76°46'29" and 78°41'34"E longitude. It is surrounded by the main Himalayan ranges on the North mainly Baralacha Pass, the mid Himalayan range or Pir Punjal on the South, the Kunjum range which separates Lahaul from Spiti on the East and the off shoot of the Pir Punjal range on the West. In its West, the Chenab river flows into Pangti valley, while in the North-East the Yunan river flows into Zaskar. The Rohtang Pass (3978 m), the gate way to valley, connects Lahaul to Kullu district. The valley can be approached through Rohtang Pass (3978 m) by road to Lahaul from Kullu, Kunjum Pass (4740 m) road to Lahaul from Spiti, Baralacha Pass (5019 m) road to

Lahaul from Leh, Kugti Pass (5043 m) partially by road and on foot, and Drati Pass (4725 m) by foot journey from Chaurah-Chamba to Lahaul. The distinctive features of the valley are snow covered peaks, massive glaciers, view of bleak, sunny, higher mountain ranges and narrow river valleys. The valley represents few prominent lakes such as Chandratal, Surajtal, Sissutal and Neelkant along with many glaciers. High mountains, waterfalls, Buddhists Gompas, Hindu Temples and trekking places are some of the attractions for tourists. The inhabitants belong to Hindu and Buddhist community. The district contains 41 Panchayats. The total area of the district is 13,835 km², out of which 1,35,369 hectares are under Forests and 4459 hectares are under cultivation. The whole area of Lahaul is divided into four valleys namely, Pattan Valley, Myar Valley, Todh Valley and Tennan Valley.

Soil:

In the valley soil is more or less loam to sandy loam with gravel. In the vicinity of villages and nearby, denuded slopes are subjected to concentrated year-round grazing; hence the soil is equally poor. On the northern aspects, in folds and hollows as also on easier slopes, the soil is fairly deep and fertile for tree growth. It is therefore, the best forests in the valley are on the left bank of the Chanderbhaga River. Due to melting of snow, the soil from the upper slope is carried down to the lower slopes where the depth of the soil is deeper. At present, soil in this tract is partially protected by the vegetation.

Climate:

The climate of the area is dry temperate to alpine types and has distinct seasons. The summer is rainless due to high mountains. The rainy season receive very less rainfall. The winter season is comparatively longer i.e., from late November to early April. During this period, heavy snow fall occurs in the Valley.

The Lahaul valley is also known for its unique faunal diversity. Some of the prominent wild animals and birds are Ibex (*Capra ibex*), Bharal (*Pseudois nayaur*), Snow Leopard (*Uncia uncia*), Musk Deer (*Moschus chrysogaster*), Ghoral, (*Nemorhaedus goral*), Himalayan Marmot (*Marmota bobak*), Wild Yak (*Bos grunniens*), Himalayan Snow Cock (*Tetragallus himalayensis*), Himalayn Snow Pigeon (*Columba leuconota*), Crow (*Corvus caurinus*), Chukor (*Alectoris chukar*) and Bar-headed Goose (*Anser indicus*)

Lahaul Tehsil Population:

Lahaul is a Tehsil located in Lahaul & Spiti district of Himachal Pradesh. It is one of 3 Tehsils of Lahaul & Spiti district. There are 140 villages and 0 towns in Lahaul Tehsil. As per the Census India 2011, Lahaul Tehsil has 2,222 households, population of 10,218 of which 5,415 are males and 4,803 are females. The population of children between age 0-6 is 682 which is 6.67% of total population. The sex-ratio of Lahaul Tehsil is around 887 compared to 972 which is average of Himachal Pradesh state. The literacy rate of Lahaul Tehsil is 71% out of which 80.42% males are literate and 60.38% females are literate. The total area of Lahaul is 4,923.78

sq.km with population density of 2 per sq.km. Out of total population, 100% of population lives in Urban area and 0 lives in Rural area. There are 10.85% Scheduled Caste (SC) and 73.39% Scheduled Tribe (ST) of total population in Lahaul Tehsil. Out of the total population, 67.48% population is Buddhist, 31.56% is Hindu and remaining follows other religion.

Pangi:

Politically the State is divided into 12 districts. Chamba is remarkable among the hill districts of the State for its natural features, situated in the north-west of the State between latitude 32°10' -33°13' N and longitude 75°45'-77°33' E. The district Chamba is divided into two Natural divisions namely, Ravi Valley including Chamba and Bharmour sub-tehsils (region between water shed of Dhaula Dhar and Pir Panjal with river Ravi and its tributaries) and Chenab or Pangi Valley including Pangi subtehsil (region between mountain ranges of Pir panjal and Zaskar with river Chander Bhaga and its tributaries).

Pangi is the remotest, rugged, snow bound, inaccessible, land-locked but picturesque and pristine narrow river valley in Himachal Pradesh. It is a small administrative subdivision of Chamba district situated in the northern extreme of the state where time and space acquired a new dimension. Sandwiched between two mighty mountain ranges, the Zaskar in the North and the Pir Panjal in the South it is an isolated valley. Positioned approximately between 32°11'30"-33°13'06"N and 75°45'-77°03'33"E, it is contiguous with Doda and Zaskar region of Jammu and Kashmir in the North and spreads over an area of 1600sq. Km. Pangi valley is irregularly triangular in shape, each side of which is about 56 kms in distance. It is bounded by Zaskar hills that lie in the Northern part of the valley and Pir Panjal in West. In southern side it shares boundaries with Lahaul and Spiti and in eastern side with Jammu and Kashmir. It is chiefly formed by river Chandrabhaga which cuts across the terrain in deep narrow gorge before entering Doda region of Jammu and Kashmir. With its deep river gorges and barren mountain peaks, it offers a wide range of scenery and vegetation.

Till recently, this valley was the remotest tribal area of Himachal Pradesh where road access to the rest of the state was established only in the mid-1990s. Now, the valley can be accessed from three directions, by crossing the Rohtang pass from Udaipur in Lahaul and Spiti via Karu Nallah, from Kishtwar in Jammu & Kashmir via Sansari Nallah and from Chamba via Sach pass (14478ft) or Cheni pass (14382ft). The 170 km long road link from the district headquarters Chamba to Killar, the headquarters of Pangi sub division via Sach Pass was established only in 2007. Earlier, people were required to undergo an 800 Kms long journey to reach Killar from Chamba via Rohtang Pass. The route through Kishtwar (part of J&K State) up to Killar is 116 kilometers in length. This road link has been recently established and small vehicles can ply up to the boundary of Pangi. These passes remain snow-clad for most part of the year and the valley can only be visited during late summers through these passes. Even during summers, much caution and care has to be exercised while crossing the passes. The weather is unpredictable and the tracks are dangerous, mostly on glaciers. There is always an impending fear of avalanches on the route. Although routes are always in the mercy of weather God as most of the road are narrow, dangerous, not of concrete, very dusty and prone to landslides, besides the many tributaries flowing through it.

Terrain:

The Pangi valley has extremely difficult and rugged terrain with indifferent climatic conditions. The land locked Pangi is squeezed between two subsystems of the Himalaya, the Zaskar and Pir Panjal Range and hence the landscape is mostly tough, mountainous, dotted with a number of valleys. Although Pangi valley comes under the Biogeographic Province 2A (North West Himalaya) (Rodger and Panwar, 1988), the region actually meets the criteria as a transition zone between the Himalaya and Trans-Himalaya (Bhatnagar *et al*, 2008). The lowest altitudinal limit of Pangi is approx. 2000m at Sansari Nala and ranges over to 6000 m comprising the lofty peaks adjacent to the Zaskar range. There are several peaks within this

valley that have never been climbed and the onward paths lead to Kashmir, Lahaul and Zaskar. There are some beautiful sub valleys in Pangi such as Sural Valley, Hudan Valley, Saichu Valley and Parmar Valley, the way through which leads to Zaskar range. This is very much evident in the faunal composition of the area which exhibits an assortment of elements from both the zones. This makes Pangi valley one of the most faunistically diverse areas in western Himalaya and also a priority area from conservation point of view (Bhatnagar *et al*, 2008). Besides, due to the somewhat inaccessible nature and low population density, vegetation cover is relatively intact which also accentuates its potential as an ideal refuge of wildlife.

Climate:

By virtue of its geographic location beyond the reach of tropical monsoon rains, the agro-climate conditions of Pangi valley come under cold and, dry zone. The overall climate of the valley is semi-arid, typical of the inner Himalaya. It is characterized by cool summers with little rain and severe winters. The winters with heavy snowfall keep the people confined to their houses in winter. However, significant changes have been noticed in the rainfall pattern since mid-nineties with much wetter years. Most of the rainfall (230-740mm) is received during July-August although precipitation has also been recorded in winter months, when direct snowfall usually occurs. During peak winter, minimum temperature throughout the valley plummets much below zero degrees Celsius. Snowfall occurs after mid-October in higher areas and reaching lower altitudes by the middle of December.

Most of the areas receive heavy snowfall (3,000-4,700mm) during December to March with lofty peaks under perpetual snow cover although occasional snowfall also occurs during April. The region on the whole experience severe winters with heavy snowfall, strong winds and frequent avalanches. Most of the streams also freeze during winter. During winter, the valley is locked from all the sides and remains cut off from the rest of the world because of heavy snowfall blocking all the approaches. Weather opens up after April and reaches a comfortable day temperature of around 28 degree Celsius during June-July in the valley. The side valleys of Pangi i.e. Sural, Hudan and Saichu are much colder with generally foggy and cold afternoons even during summer months.

Pangi Tehsil Population

Pangi is a Tehsil located in Chamba district of Himachal Pradesh. It is one of 10 Tehsils of Chamba district. There are 106 villages and 0 towns in Pangi Tehsil. As per the Census India 2011, Pangi Tehsil has 3,952 households, population of 18,868 of which 9,579 are males and 9,289 are females. The population of children between age 0-6 is 2,299 which is 12.18% of total population. The sex-ratio of Pangi Tehsil is around 970 compared to 972 which is average of Himachal Pradesh state. The literacy rate of Pangi Tehsil is 62.37% out of which

72.17% males are literate and 52.27% females are literate. The total area of Pangti is 1,515.46 sq.km with population density of 12 per sq.km. Out of total population, 100% of population lives in rural area. There are 6.6% Scheduled Caste (SC) and 90.18% Scheduled Tribe (ST) of total population in Pangti Tehsil. A total of 94.92% population believes in Hindu religion and 4.68% are Buddhists.

Threats to wildlife in the Landscape:

The Himalayan region represents a myriad of human cultures and linguistic diversity that includes several tribal communities. Despite all the ecological, social and cultural richness, Himalayas have not received the required attention to conserve and maintain its environment. The reasons may be lack of knowledge about the region and remoteness.

The evolution of the unsustainable socio-economic patterns has been affecting the fragile landscapes and delicate ecosystems of the Greater and Trans-Himalayan regions making these more susceptible to the natural disasters, biodiversity loss and habitat changes. The landscapes are facing habitat degradation and fragmentation due to unsustainable livestock grazing, impact on indigenous species due to invasive species, forest land diversion, use of unregulated pesticides for agriculture, equipment and techniques to snare wild animals to protect their crops, climate change and forest land diversion, unsustainable resource extraction by local communities of natural resources (fodder, fuelwood, medicinal herbs, grasses, berries for food), economic and infrastructure development, unregulated tourism, poaching of wild animals including snow leopard, blue sheep and illegal extraction and trading of medicinal plants. The threats to habitats due to climate change is accelerating with series of natural disasters caused by unprecedented changes in the patterns of rainfall and dry swells.

Primary and secondary studies in the landscape area have shown the hostile impacts of excessive livestock grazing. Competition for grazing land often leads to conflict between wild ungulates and domestic livestock. In absence of enough food, wild ungulates raid the human settlements and prey on domestic livestock. This may result in retaliatory killing of the wild animals by the locals in vengeance. Crime against wild animals are also increasing. Killing and illegal trading of wild ungulates is taking place, although the cases are not documented anywhere. Another major concern is the extraction (legal as well as illegal) of natural resources for fuel, fodder, medicinal herbs, grasses, etc. Medicinal and aromatic plant (MAPS) are extracted from the landscape unsustainably, creating a toll on the region.

Connectivity of the landscape to the outside world is hindered for almost 6-7 months and even the life in the landscape moves at a slow pace due to heavy snow fall. All generation residing in this high-altitude landscape lost almost half of their lifetime due to winter confinement that could otherwise would have been used to create more wealth, welfare and prosperity for the society. The economic setback experienced by the locals is compensated during summers, when they practice agriculture, horticulture and other livelihood options. Tourism is a viable option for the locals, but it needs to be sustainably developed and managed. Excess tourist inflow can create ecological pressure on the landscape.

There are considerable threats to ecology in the landscape. There is a need to recognise that there should be proactive efforts to maintain wildlife but simultaneously local needs and any conflict that may arise between local and wildlife should be addressed.

Following are the major threats categorised with respect to the landscape.

Overgrazing, Competition with livestock, rangeland degradation and prey declines

Himachal is a predominantly mountainous state. Forests in Himachal Pradesh have a very productive ecological niche. Latitudinally, the state falls in the sub-tropical zone, and its geographical location and good forest cover have further enriched it, both biologically and economically. The forests of Himachal Pradesh are not only of importance for the state, but also have a strong influence on the ecology, climate and bio-resources of the neighbouring states of Punjab, Haryana and Rajasthan. According to the Himachal Forest Report 2002, nearly 16,376 sq.km. or 29.41% of the total geographical area of the state is under alpine pastures and perpetual snow cover (Himachal Forest Report, 2002).

Although human population density in snow leopard landscapes is relatively low, its habitats are heavily used by people whose livelihoods depend on traditional livestock herding. With growing human populations, livestock herds are growing too and, in some places, far exceed the capacity of the land to support them. Himachali Gaddis have traditional rights of grazing including in the highland pastures. Current government efforts to regulate Gaddi herding have their origins in nineteenth-century British interests in commercial timber extraction from the Himalayan coniferous forests. Over the past century, the government has attempted to control the numbers of animals each herder is permitted to graze, to restrict camping and movement during migration, to impose restrictions on the actual areas grazed, and gradually to reduce herd sizes (Saberwal, 1996). The resulting overgrazing leads to degradation of rangeland and may result in soil erosion. Competition for food with large and growing domestic livestock populations also reduces wild prey numbers, which already live at relatively low densities due to the low productivity of the habitat.

There is a lack of current qualitative and quantitative information on the extent of alpine pastures and their carrying capacity, and thus these pasturelands are also under the threat of overgrazing and climate change. Overgrazing does not only affect the health of a pastureland but also the health of the animals grazing there. It has been observed that overgrazing can lead to productivity and health problems in the livestock, like low milk production and unhealthy progeny. With agro-pastoralism extensively practiced across snow leopard range, there is great potential for competition for grazing resources between domestic livestock and the wild herbivores that make up the main prey of the snow leopard. Overgrazing is also affecting the population of blue sheep and ibex that are key not only prey species of the snow leopard but is also key biological indicators for the snow leopard landscape habitat area. There is a comprehensive lack of monitoring the population of the blue sheep and ibex in the landscape area and in absence of a systematised approach, updated statistics are not available.

For centuries humans have co-existed with wildlife practicing nomadic or semi-nomadic pastoralism herding sheep and goats' flocks, cattle, horses, yaks and camels. Although relatively few humans live in snow leopard habitat, their use of the land is becoming

increasingly pervasive, resulting in escalating conflicts between conservation and livestock production even within protected areas (Jackson et al 2010).

Extremely few cases of wild snow leopard mortality due to disease have been reported in the literature and it is difficult to evaluate the potential significance of this threat.

Depredation on Livestock and Retaliatory Killing

The intimate interspersion of people in protected areas often results in conflicts between humans and wildlife (Rodgers 1989). Most wildlife protected areas in India support various forms of land use, such as agriculture, livestock grazing, and collection of minor forest produce. Livestock grazing is especially widespread, and livestock holdings form an important component of the local pastoral and agricultural economy. Kothari et al. (1989) report livestock grazing in as many as 73% wildlife sanctuaries and 39% national parks in India (of the 101 and 14 protected areas surveyed respectively in those categories), with livestock densities up to 1500 per km².

Studies show that animal husbandry contributes 10 to 32 % of household income in different agro-climatic zones of the state. Importance of livestock sector in the state of Himachal Pradesh is also reflected by fact that 90% of the households keep some bovine and 30% rear goat and sheep (Chand, 1995). But ecologically, it is asserted that livestock pressure in the Indian Himalayas is excessive, which is a major cause of ecological degradation (Shah, 1982). Therefore, emphasis is laid on the need to reduce the biotic pressure of the livestock on the natural resources by replacing less or unproductive animals with improved and healthy stock and reducing excessive grazing of the pastures.

Not surprisingly, livestock often greatly outnumber wild ungulates within many protected areas. Such a disproportionate presence of wild and domestic ungulates results in killing of livestock by wild predators, and thereby a conflict of interests between local communities and wildlife managers. Human-wildlife conflicts are acute when the species involved is highly imperilled while its presence in an area poses a serious threat to human welfare (Saberwal et al. 1994). Such is the conflict between wild carnivores and pastoralists in trans-Himalaya, one of the most fragile, and yet the least represented, of all the biogeographic zones in the Indian protected area network (Rodgers & Panwar 1988).

The trans-Himalaya biogeographic zone harbours at least 12 mammal and bird species listed in Schedule I of the Indian Wildlife (Protection) Act, 1972 (Anon. 1992). Among these, the snow leopard, *Uncia uncia*, is globally threatened, and is categorized as endangered (in danger of extinction) by the IUCN (1990). The Tibetan wolf, *Canis lupus chanku*, represents another globally-threatened species, categorized as vulnerable (IUCN 1990). Both these species are in conflict with humans in most parts of their range, specifically due to the damage

they cause to livestock (Schaller 1977; Fox et al. 1988; Mallon 1988; Oli et al. 1994; Meriggi & Lovari 1996; Nowell & Jackson 1996).

Depredation rates due to snow leopards and sympatric predators ranges over 12% of livestock holdings in hotspots in India (Bhatnagar et al. 1999; Mishra 1997). Herders are especially angered by events of surplus killing when a snow leopard enters a corral and up to 50 or more of the confined sheep and goats are killed in a single instance (Jackson and Wangchuk 2001). Depredation tends to be highly site specific, with losses varying greatly between successive years and even between nearby settlements (Jackson et al. 2010; Suryawanshi et al. 2013). However, in the landscape area, cases of livestock depredation by snow leopard are very rare. Depredation by brown and black bear are prevalent.

Large depredation losses may create such levels of anger towards snow leopards, wolves and other large predators that local communities lose any tolerance and view predator extermination as the only solution to the conflict (Oli et al. 1994). Therefore, understanding and managing conflicts over livestock depredation represents an important goal for effective snow leopard conservation action. Conflicts involve two important dimensions – the reality of damage caused by snow leopards to livestock, and the resulting perceptions and attitudes of humans impacted by such economic loss (Suryawanshi et al. 2013).

People's attitudes and tolerance for snow leopard varies, depending upon their religious beliefs, income status, educational level, perception of threat that snow leopards pose to their livelihood, and the extent of livestock losses they and their community have suffered (Mishra 1997; Jackson and Wangchuk 2004; Suryawanshi et al. 2013, 2014). Livestock losses attributed to snow leopards may be exaggerated, either mistakenly or deliberately. Nonetheless, perceptions can have strong emotional and political consequences, ultimately leading to the persecution of snow leopards or other carnivores.

Wildlife Tourism

Wildlife provides significant economic opportunities for local communities and the government. Private nature reserves and government-protected areas provide useful complements to each other. In many cases, establishing protected areas for wildlife tourism is bringing fundamental changes to the surrounding lands, increasing the proportion of employment in service and retail sector while significantly reducing the exploitation of natural resources for consumptive uses. Such economic changes do not always come about smoothly, but it has been clearly demonstrated in many parts of the world that recreation related employment can be more than five times greater than employment in resource exploitation in the same territory, and the gross economic benefits are often more than ten times greater. Spurred by quick incoming economic gains and local pride in global recognition of place as a sought-after tourism destination, tourism soon becomes unsustainable irreparably damaging

the pristine landscape. Therefore, all activities related to tourism in the landscape need to be closely watched, monitored and evaluated.

Tourism in snow leopard habitats presents an opportunity to provide a great visitor experience while enhancing support to local livelihoods along with snow leopard and biodiversity conservation. It allows people to experience the uniqueness of these high mountain ecosystems while potentially building public support for, and contributing to their conservation. However, if uncontrolled, tourism also presents a threat to these fragile landscapes and the plants and animals that inhabit them. To ensure that these landscapes remain intact and continue to provide tourism opportunities in the long term, it is crucial that tourism ventures adopt responsible, non-invasive, and sensitive practices with respect to the ecosystem and the local cultures. It is important to manage both tourist density, their journeys to and within the landscape, and their mode of interaction with wildlife. A sudden influx of a large number of tourists within a given area of wildlife habitat is likely to disturb these animals, their breeding, prey base and the vegetation. The amount of waste created by visitors and transport animals combined with physical damage to the habitat can be devastating, often to the very industry (tourism) itself.

Lahaul-Pangi Landscape is rich in scenic, cultural, traditional and ecological diversity. The region has a great potential to be promoted as a wildlife tourism hotspot. However, the landscape is inaccessible from outside world for about 6-7 months during winters due to heavy snowfall. Connectivity to the landscape is snapped even during monsoons due to high risk of landslides. Apart from inaccessibility, an assessment for institutional and infrastructural adequacy for all the major tourist attractions needs to be carried out on priority. Homestays presently are not certified or registered with the government department. Tourism in the landscape is not yet popular and developed but can prove to be a major economic turnaround for the local economy. In addition, the data on tourism inflow in the landscape area is not available that hinders making a suitable planning for the landscape area. However, a methodical promotion and marketing strategy are needed to develop a sustainable tourism in the unique high-altitude landscape.

Handicraft Industry

In Himachal Pradesh, handloom industry plays a very important role in the state economy. The uniqueness and speciality in weaving make them famous on the national and international levels. Due to state government intervention through financial assistance and implementation of various developmental and welfare schemes, now these handloom industries of the state have been able to compete from the power loom and mill sectors. These products reach to the people by selling through setting stalls in fair, exhibition and through setting special shops in different district and states. This sector is contributing towards export earnings also. The handloom sector is the most important earning sector after

agriculture providing direct and indirect employment to the weavers in Kullu, Manali, Chamba, Mandi, Lahaul and Spiti districts of Himachal Pradesh.

Handloom industry is fundamentally labour intensive and utilizes a traditional technique in the manufacturing process which are not cost effective at all and that makes the production at higher cost. The weavers are using “khaddi” as a handloom machine. Although the output of these machines is low as a weaver needs to travel across the breadth of the “khaddi” while laying the thread yet they are producing original product. Some new mills have started operation in Himachal and due to which the conversion time from wool to thread has become shortened but again the power looms are the biggest beneficiaries.

Loom industries in Ludhiana (Punjab) copied the Himachali shawl which has a low cost. A handloom shawl may take about a week to manufacture whereas power looms churn out thousands in a day. This production pose economies for power loom products and it makes a little difference between handloom and power loom for ignorant customer. They not only supplied cheap and inferior varieties of shawls but also offered huge discounts to tourists. At the market front, most of the buyers fail to understand the difference between handloom and power loom products. Pashmina – a brand name for handloom products some time ago is hijacked by power loom one.

The sheep is sheared twice in a year at specified centres, primarily controlled by the wolfed. A significant proportion of the wool is procured from nomads, who travel from Ropar in Punjab to Manali and above. For a sheep owner the security/care of the sheep is the biggest challenge. Their major concern lies in the ‘Sheep Insurance’ clause that requires the dead body of the sheep to be presented for claiming insurance (it becomes quite impossible for them to get a sheep out of drowned water or to get one from the deep valleys) (Attri, 2017).

NTFP Extraction

There is an increasing recognition that non-timber forest products (NTFP) can fulfil important community needs and improve rural livelihoods. The NTFPs play an important role in the socioeconomic as well as traditional healthcare of local people and livestock (NAEB and Dr YS Parmar University of Horticulture and Forestry). NTFPs are traditionally being collected from the landscape and forests in it by the rural population for meeting their household needs and also for generation of cash income to some extent. In recent years due to increasing demand for natural and herbal products, there has been an increase in demand for NTFPs from this region. Since very little area is under cultivation of NTFP species, most of the demand is met from the landscape and forests in it. Most of the landscape and specifically the forests are in a highly depleted state.

The natural environment is major source of healing remedies worldwide. The use of medicinal plants as a medicine in the past had a good advantage over the present conventional drugs.

Because, many of the traditional folk remedies used in the past are now being manufactured as pharmaceutical preparations prescribed by physicians.

Gaddis, Kinnauras, Pangwal and Lahaulis are the major tribal communities of Himachal Pradesh. These communities inhabit the wet temperate to sub alpine region in the Western Himalayas. Tribal communities have their own ways of life, cultural identities and customary modes of living which they had developed through years of experience by interacting with nature. Non timber forest products also play a major role in their economy. Non timber forest products are used in the form of food, fodder, fibre and household articles, medicines and ornaments and supplement their income especially during lean seasons beside providing religious and aesthetic needs.

To most tribal people, extraction processing and marketing of NTFP is a source of employment and income generation. Plant products especially the non-timber forest products have always been an ever-available first-rate drugstore for the tribal communities. They are dependent on these medicinal plants to cure their ailments. The tribal women folk have the natural inherited knowledge about these medicinal plants as a result of their long-term association with the forests. They find them effective, easily available and cost effective.

For the local communities of the landscape area, NTFPs are a source of medicine, income, and to meet their religious and aesthetic needs. Local people, during discussions, informed that they do not extract NTFPs in an illegal manner, however, stakeholder consultation reflected that outsiders from Churah (Tindi Panchayat) carry out illegal and unsustainable extraction of NTFPs from the forest and other areas of the landscape. It was informed during consultation that to curb this unsustainable practice, BMCs (Biodiversity Management Committees) are being set-up as per the Biological Diversity Act, 2002. This should also solve the problem of non-availability of harvest statistics. BMCs are required to maintain PBRs, BCPs and harvest and growing stock data to ensure sustainable and equitable sharing of the benefits arising from commercial use of NTFPs and other biological resources. During the discussions, people from local communities also inquired if they could grow medicinal plants in their fields rather than extracting MAPs from the forest. This is a good indication, and local people should be made aware of the promotional schemes as also the regulatory provision on the subject.

NTFP has a big market with a high risk of illegal extraction. This extraction is mainly practised through unsustainable means, which not only degrade the area but also put a risk on natural regeneration of the product. A number of rules and regulations are in place by the state and the national government to manage and regulate NTFPs and MAPs extraction such as HP Forest Re-Revised Eco-Tourism Policy of 2017, HP Medicinal Plant Sector Policy of 2006, Scheduled Tribes and Other Traditional Forest Dwellers (Recognition of Forest Rights) Rules of 2008, HP Forest Sector Policy and Strategy of 2005 and HP Participatory Forest

Management Rules of 2000. Compliance to these rules need to be ensured and monitored in perpetuity to promote a sustainable NTFP market.

Wildlife crime control

Wildlife crime is one of the topmost agendas at the national and international levels. Poaching and illegal wildlife trade is on a rise and the problem is even more aggravated in transboundary areas of the state. Wild animal parts and products are illegally traded. Although illegal trade has always been an issue but this has got unprecedented high attention in last few years because of the threatened and endangered status of the locally important species such as snow leopard. It is, therefore, essential that wildlife crime is tackled as a priority issue for both the conservation and development of the landscape. In Lahaul-Pangi landscape, reports of illegal trade have often been made, but hardly any case is registered.

Apparently, even though such illegal practices are taking place, communities refuse to acknowledge or verify such claims as they are close-knit, and may even be enjoying some benefits from the illegal trade. While some members of the community are willingly involved in this trade, it is the innocent community at large who face restrictions, bans against entering the key areas. This would need to be studied closely. Traditionally, local people used to take part in patrolling to control illegal practices of poaching and illegal trading, but presently this practice is not being followed. There is need to build incentives for the local communities especially for its younger generation in the patrolling mechanism, which will promote stakeholdership of the communities in protection and conservation of the landscape. This will help to some extent in checking the migration of the young generation to outside areas in search of work and employment.

Poaching and illegal trade are not just limited to a country but the traders use transboundary treks and channels to illegally export and sell the products. So, the efforts should be combined and coordinated by the countries sharing the borders. They need to come up with transboundary agreements to develop effective mechanism and rules against poaching and illegal wildlife trade.

Feral Dogs:

Competition with feral dogs is an emerging threat in the landscape. Local communities have not reported cases of depredation of wildlife by feral dogs but secondary literature has mentioned the threats that feral dogs pose to wildlife. In Lahaul-Pangi reduced prey as a result of competition with migratory livestock, illegal hunting and wildlife trade by the local community, and immigrant labourer and migratory communities, and depredation by dogs, are the severe threats. Areas grazed by migratory livestock were also prone to illegal hunting

by migratory herders and depredation of wildlife by dogs (migratory herders are accompanied by guard dogs) (Ghoshal et al, 2017).

Feral dogs survive and reproduce independently of human intervention or assistance. While it is true that some feral dogs use human garbage for food, others acquire their primary subsistence by hunting and scavenging like other wild canids. The dogs also compete with the Snow Leopard and Tibetan Wolf for scarce food resources and as these dog's hunt in large packs, they have a significant advantage over the leopard or wolf. The situation is further aggravated by the improper garbage management of security forces and communities, as more garbage provide food for more dogs and sustain bigger populations. Thus, proper waste management needs to be in place.

Waste Management

Solid waste and littering are becoming an environmental menace and more so in hilly areas and terrains of the landscape where the waste ultimately finds its way to the banks of streams and rivers, besides dotting the landscape here and there. Local community, tourists, migratory labour, graziers and security forces are the main players responsible for waste hazard. Hilly towns and cities are impacted more because of the small size of towns, lack of civic facilities, difficult terrain, high influx of tourists, lack of community participation, and awareness amongst all stakeholders. Not just the tourists but also the hotel owners and local people are equally responsible for making the situation so difficult. Waste not only pollutes the river and other water bodies, but it also pollutes the groundwater resources.

The potential impact of a tardy waste management is reflected in choking of drains, streams and rivers, pollution of water, soil and air, health problems, and feral dog menace. While waste and littering may not seem as a big problem right now, but it will soon be a cause of poor air quality, choking water bodies, polluted water, and thus a breeding ground for diseases. While it is the responsibility of the state to intervene and take some long term and quick term steps, including policy and regulatory measures, but the major responsibility would always lie on the local community who are resident of the landscape, and whose livelihoods are intertwined with the health and quality of the landscape environment. Thus, leading role of the community cannot be overlooked. Community should take care of waste collection and segregation at the source and disposal at appropriate sites. Unmanaged and untreated waste generated by security forces in far flung areas of the landscape leading to the feral dog problem threatening not only the humans but, also the prey base, and cubs of snow leopard, needs to be addressed specifically and exclusively.

Connectivity

Himachal Pradesh is predominantly an agriculture intensive state. Most of the contribution to the economy comes from the agriculture. And thus, it gives a grim scenario as agriculture cannot be practised on a yearly basis in the snow-covered areas of Lahaul-Pangi. Even when

the winter is at its peak, tourism opportunities come at a halt because of the closure of roads and inaccessibility of treks. This creates a six-month window off leisure time and not much income for people of these areas. Agriculture acts as an only source of income for these households which lack in training to carry out non-farm activities. This led to pressure on the snow leopard habitat for food, resources and at times become the cause of Human Wildlife conflict. But in last few years, due to shrinking land cover, fragmentation of land, industrialisation the income from the agriculture has reduced drastically and people have started drifting towards non-farm activities. Taken as an alternative to farm sector in terms of making livelihoods and poverty reduction (J.R. Davis, 2003; Reardon, Berdegue, Barrett, Stamoulis, 2007), it has occupied a very prominent place in rural development studies. Nonfarm activities have changed the whole traditional pattern of labour use in rural areas as labour is utilized in striking diverse activities ranging from home-based cottage industries to sophisticated multinational agribusiness firms, from casual labour works to high paid services (Haggblade, 2007; Rahut, 2006).

People generally lack awareness about their rights, and since the area is blocked from any telecommunication, or with the other major town throughout the 6 months, all generation lost almost half of their lifetime that could have been used to prosper the society. In 1984, late Indira Gandhi, then Prime Minister of India had visited Pangti, she offered people to permanently migrate to Dehradun where people would be given land, house, and dignified living as the road construction towards such remote areas for such a small population (back then up to 5000) was too expensive. However, people did not buy into the idea and turned down the offer. She then decided to start cutting the roads and started to connect the area with rest of the HP. Later given the areas proximity with China, J&K, there has been some progress in road construction, however, the results have not been that fast. The BRO as appeared during the interviews is doing the work at snails' speed, what was the condition ten years ago, things have remained the same. The valley and villages nearby have remained relatively less affected to the outside city influences that we see in rest of the India or even other Himalayan towns of India. Clearly there is a less plastic, less dust, less human waste, and almost no overflowing or foul-smelling sewers in the remote areas.

Now, communities have been demanding all-season roads or tunnels to connect the region with the outside world, but the economic and ecological implications of it are high and need proper assessment to provide 12-month connectivity that is not at the cost of the environmental and ecological degradation of the pristine snow leopard landscape. If tunnels or roads are planned, mitigation studies would need to consider the ensuing muck generation and the vehicular traffic on such an ecologically fragile landscape.

Lack of awareness among local people and policymakers

There is a significant lack of awareness and understanding of the plight of the snow leopard; the value of snow leopards, prey, and habitat; and the local and regional consequences of the

on-going degradation of its ecosystems. This is true at all levels of society within and outside the snow leopard range, from local people to leaders of governments and from the private sector to the general public. Globally, snow leopards are less well-known than other charismatic species, such as tigers and elephants; as a result, less funding has been available for snow leopard conservation. There is also a significant lack of awareness regarding the policies, schemes, acts, rules and guidelines in the area relevant to the conservation and protection of the snow leopard.

Q3. Is there any project/scheme implemented by your department in this landscape?

- a. Yes
- b. No

If yes, name a few of them.

Q4. Are you aware of declining population of flora and faunal species in your area?

- a. Yes
- b. No

Q5. Is there is any noticeable decline in forest area?

- a. Significant
- b. Insignificant
- c. No comment

Q6. Is there any biodiversity hotspot in the proposed snow leopard landscape?

- a. Yes
- b. No

If yes, please provide names.

Q7. What according to you are the conservation challenges in the landscape?

- a. Hunting/ Poaching
- b. Decline in important natural resources
- c. Harvest of fuelwood and timber
- d. NTFP collection
- e. Urbanization
- f. Human wildlife conflicts
- g. Wildlife crime
- h. Invasive alien species
- i. Unregulated livestock grazing
- j. Unregulated Tourism
- k. Climate change and shortage of water
- l. Others (Please mention)

Q8. Does the existing map of landscape correctly indicate landscape boundary?

- a. Yes
- b. No

Q9. Define extent and boundaries of this landscape?

- a. It is larger than actual
- b. It is smaller than actual

- c. Same as actual

Comments:

Suggestion:

Q10. What is your perception regarding effectiveness of relevant policies and schemes of the government w.r.t conservation and sustaining the livelihood of the people?

- a. Relevant
- b. Not Relevant

Comments: Suggestion:

Q11. List the important policies and programmes for conservation of snow leopard and its habitat.

| S. No | Name of Policy | Duration | Fund allocated | Objectives | Progress till date |
|-------|----------------|----------|----------------|------------|--------------------|
| | | | | | |

Q12. What are the major gaps in policies and their implementation for conservation of snow leopard?

- a. Implementation strategies
- b. Inadequate coverage
- c. Lack of participation by locals
- d. Awareness
- e. Training
- f. Information gaps

Q13. Your perception about the livelihood status of the people living in this landscape?

- a. Very good
- b. Good
- c. Poor
- d. Very Poor

Q 14. What is the primary source of Livelihood in the proposed landscape?

- A. Traditional practices
- B. Agriculture
- C. Business/ Trade
- D. Government
- E. Private Job
- F. Animal husbandry
- G. Silviculture
- H. Tourism

Q15. Challenges related to livelihoods of people living in this area?

- A. Insufficient income
- B. Restriction to access to natural resources
- C. Lack of useful raw material
- D. Any restriction by law
- E. Lack of interest
- F. Other (Please specify)

Q16. Are you aware of human wildlife conflicts in your area?

- a. Yes
- b. No

If yes, please mention the area, species involved in such conflicts.

Q17. What could be the possible reasons for Human wildlife conflicts?

- a. Grazing
- b. lack of awareness
- c. habitat degradation
- d. Lack of food/prey species
- e. Human Interference

Q18. Has the department evaluated or monitored the impact and progress of the developmental initiatives?

- a. Yes
- b. No
- c. Planned in future

If yes, please provide details

Q19. Please provide the separate SWOT analysis for Conservation as well as Development for the Landscape in your state. (to be filled by official)

Conservation

Gender and age

Q1. Are you aware of the Project SECURE Himalaya and its objectives funded by UNDP and MoEFCC?

- a. Yes
- b. No

If yes, please mention some of key objectives of this assignment

Q2. How did you come to know about this project?

- a. Newspaper/ magazine/Radio/TV
- b. UNDP website
- c. Workshop/ conference
- d. Others (Please mention)

Q3. Are you the part of this project?

Q4. Are you aware of any Human-wildlife conflict in your area?

- a. Yes
- b. No

If yes, please mention location of these incidences and species involved

Q5. What are the possible reasons for Human Wild life conflicts?

- f. Grazing
- g. habitat degradation
- h. Lack of food/prey species
- e. Human Interference
- i. Invasion of alien species

Q6. Are you aware of the landscape that exists in your state which is an important habitat for species like Snow Leopard?

- 1. Yes
- 2. No

Q7. Can you name some important species existing in this landscape?

- Tree Species of economic importance (oil and timber resources):
- Highly traded Medicinal Plants:
- RET species:

Q8. Which are the important conservation policies and initiatives of the state government or other agencies in this landscape?

| S. No | Name of Policy | Duration | Fund allocated | Objectives | Progress till date |
|-------|----------------|----------|----------------|------------|--------------------|
| | | | | | |
| | | | | | |
| | | | | | |

Q9. What according to you are the conservation challenges in this landscape?

Industry/Trade/Business Entities

Date and Time of Interview:

Location of Interview:

Name of the Respondent:

Contact Details:

Organisation/Company:

Work scope:

Number of staffs:

Organisation Type: MSME, Navratan, Pvt. Ltd., others:

Gender and age

All questions w-r-t to landscape (snow leopard landscape)

Q1. How your company is dependent upon resources available in the proposed landscape area?

| Particulars | Location/Area | Quantity Required per year/Month | Products Manufactured |
|-------------|---------------|----------------------------------|-----------------------|
| | | | |
| | | | |
| | | | |

Q2. Are you aware of access and benefit sharing system (ABS) and its regulations?

- a. Yes
- b. No

Q3. Are you aware of the concept of sustainable use of natural resources?

- a. Yes
- b. No

Q4. What is the ratio of women to men ratio of staff in your organization?

Q5. What according to you is the scope of inclusion of local species of flora in your industry?

- a. Very good
- b. Average
- c. Poor
- d. Potentially dangerous
- e. Not Recommended

Q6. What, in your opinion, are the best options to increase the livelihood opportunity for local people?

- a. Capacity building and training
- b. Introduction of alternative livelihood

- c. Less restriction to access to natural resources
- d. Promoting traditional culture and practices
- e. Other, please specify

Q7. What are potential modules/options that could be adopted by locals to improve their livelihoods

Q8. Are you aware of habitat landscape for species like Snow Leopard in the state?

- a. Yes
- b. No

Q.9 Have you heard about Human Wildlife conflicts?

- a. Yes
- b. No

If yes, please specify the area and wildlife species involved in such conflicts

Q10. How your company/ organization is helping locals to secure their livelihoods?

- A. Providing Jobs
- B. Trainings at regular intervals
- C. Provide free sapling/ seeds
- D. Provide free equipment/ instrument etc.
- E. Others (Please specify)

Q11. What according to you are the biodiversity and forest conservation challenges in this landscape?

- a. Hunting/ Poaching
- b. Decline in important natural resources
- c. Harvest of fuelwood and timber
- d. NTFP collection
- e. Urbanization
- f. Human wildlife conflicts
- g. Wildlife crime
- h. Unregulated livestock grazing
- i. Unregulated Tourism
- j. Climate change and shortage of water
- k. Others (Please mention)

Q12. How many of your employee come from the aforementioned landscape?

| No of Employee from Landscape | Man | Woman |
|----------------------------------|-----|-------|
| | | |

Comments and Suggestions

Q13. What is your perception about the socio-economic status of the people living in this landscape?

Q14. What other initiatives are required from government to improve the livelihood of locals?

Q15. What have been the impacts of the developmental initiatives in the state by the government/other agencies on the industry? Please provide list of any landmark event or initiative that had a direct/indirect impact on industrial productivity in the state? Can you define specific impacts on the aforementioned landscape?

Q16. What are the potential Goods and Ecosystem Services produced by the natural areas of the aforementioned landscape?

Q17. Please provide the separate SWOT analysis for Conservation as well as Development for the proposed Landscape in your state.

Conservation

| | |
|------------|---------------|
| Strengths | Opportunities |
| Weaknesses | Threats |

Development

| | |
|------------|---------------|
| Strengths | Opportunities |
| Weaknesses | Threats |

Q18. If an initiative under GEF-UNDP-Gol is taken for the development of the Landscape, will your company be willing to collaborate or support the initiative? If yes, please indicate possible areas of collaboration.

Q19. Please provide any other remarks or suggestions for effective conservation or development of the landscape.

Q.20. What are your suggestions in bringing a level of coordination between different stakeholders and agencies?

Questionnaire-IV

Local Experts and Leaders

Date and Time of Interview:

Location of Interview:

Name of the Respondent:

Contact Details:

Affiliation, if any:

Sector of work/experience:

Qualifications:

Gender and age:

Q1. Are you aware of the UNDP-MoEF and GEF initiative to propose some area in your state as Snow Leopard Conservation Landscape?

- a. Yes
- b. No

Q2. Can you name some other important flora and fauna present in the proposed landscape?

Flora:

Fauna:

Q3. Which are the important conservation areas present in the proposed landscape?

Q4. What are the major sources of income of local communities?

- | | |
|-------------------------------|---------------------------|
| a. Agriculture | e. Silviculture |
| b. Animal Husbandry | f. Business |
| c. Traditional work | g. Other (Please specify) |
| d. Private or Government Jobs | |

Q5. What according to you are the major conservation challenges in this landscape?

- a. Hunting/ Poaching
- b. Decline in important natural resources
- c. Harvest of fuelwood and timber
- d. NTFP collection
- e. Urbanization
- f. Human wildlife conflicts
- g. Wildlife crime
- h. Unregulated livestock grazing
- i. Unregulated Tourism
- j. Climate change and shortage of water
- k. Others (Please mention)

Q6. How significant have been development activities funded by government departments in the past?

- a. Significant
- b. Average

- c. Insignificant

Q7. What are the major gaps in policies/ Laws and their implementation?

- a. Implementation strategies
- b. Inadequate coverage
- c. Lack of participation by locals
- d. Lack of vision
- e. Awareness
- f. Training
- g. Information gaps

Q8. How livelihood of local communities can be improved?

- a. Introducing agriculture
- b. Industries
- c. Encouraging alternative livelihoods
- d. Training and capacity building of locals
- e. Other (Please mention)

Q9. What is your perception about the livelihood status of the people living in this landscape?

- A. Good
- B. Poor
- C. Very Poor

Q10. Name some of the potential options that could be adopted by locals to improve their livelihood?

Q11. Existing practices and challenges related to livelihoods of people living in this area?

- N. Insufficient income
- O. Access to natural resources
- P. Lack of useful raw material
- Q. Any restriction by laws
- R. Lack of interest
- S. Other (Please specify)

Q12. What are the important projects/programs implemented in conservation area?

| Name of Project/Scheme | Implementing agency | Duration | Major outcomes | Key Gaps |
|------------------------|---------------------|----------|----------------|----------|
| | | | | |
| | | | | |
| | | | | |
| | | | | |

Q13. How policies/ programs improved the economic status of local communities

- a. Significantly
- b. Moderately
- c. Insignificant

Q14. What is your perception and views on historical trends of natural resources, livelihoods and developmental status of the state and the aforementioned landscape?

| Factor | Response (1,2,3,4)* |
|-------------------------------------|------------------------|
| Forest area | |
| Per capita income | |
| Traditional culture and practices | |
| Agriculture land | |
| Traditional Governance | |
| Development status at village level | |
| Biodiversity (flora and fauna) | |

*1: increased, 2: Decreased 3: No change 4: Can't say

Q15. Please provide the separate SWOT analysis for Conservation as well as Development for the Landscape in your state.

Conservation

| | |
|------------|---------------|
| Strengths | Opportunities |
| Weaknesses | Threats |

| | |
|--|--|
| | |
|--|--|

Development

| | |
|------------|---------------|
| Strengths | Opportunities |
| Weaknesses | Threats |

Q16. Does the landscape boundary correctly justify extension of proposed snow leopard conservation landscape?

- a. Correctly indicated
- b. It is more w.r.t represented map
- c. It is less w.r.t represented map

Q17. Have you heard about Human Wildlife Conflicts in the proposed?

- a. Yes
- b. No

If yes, please specify the area and wildlife species involved

Q18. What are the possible reasons of Human wildlife conflicts?

- a. Grazing
- b. lack of awareness
- c. habitat degradation
- d. Lack of prey
- e. Human Interference

Comment and Suggestions

Q19. If an initiative under GEF-UNDP-Gol is taken for the development of the proposed landscape, will you/your department will be willing to collaborate or support the initiative? If yes, please indicate possible areas of collaboration.

Q20. Your remarks or suggestions for effective conservation or development of the landscape.

Q.21. What are your suggestions in bringing a level of coordination between different stakeholders and agencies?

Questionnaire V

Household Survey

Date and time of interview:

Name of village:

Name:

Age:

Gender:

Category: SC/ST/OBC/MBC

Faith:

Perception Questionnaire:

Q 1: Are you aware that Snow Leopard is found in your area?

- a. Yes
- b. No

Q 2: Have you ever sighted a snow leopard in the area? If yes, how many?

- a. 0-1
- b. 2-4

- c. 5-8
- d. More than 8

Q 3: Name of the area where snow leopard has been sighted?

Q 4: What has been the trend of snow leopard population?

- a. Increasing
- b. Decreasing
- c. No change

Q.5.Are you a victim of Human-wildlife conflict?

Q 6: Have you witnessed any incidence of human-wildlife conflict?

- a. Yes
- b. No

Q 7: What are the wildlife species involved?

Q 8: What do you think is the reason for such conflicts?

- a. Grazing
- b. lack of awareness
- c. habitat degradation
- d. Lack of prey
- e. Human Interference
- f. Any other

Q 8: What are the other important wildlife species that you have sighted in the area?

Q 9: What are the important plant species that can be found in the area?

Q 10: Are you aware of the UNDP-Gol-GEF “Project SECURE Himalaya”?

- a. Yes
- b. No

Q 11: Are you aware that your area is under the proposed snow leopard landscape?

- a. Yes
- b. No

Q.12.Were you the part of the recent population estimation initiative of the FEWMD?

Q.13.Have you taken part in the wildlife conservation activities? Name it

Q.14.What are your suggestions in bringing a level of coordination between different stakeholders and agencies?

Comments:

Suggestions:

Annexure-2:

Review of Research Papers

| S. No | Title | Main focus | Key Outcomes | Reference |
|---|--|--|---|--|
| Wild Life (Snow Leopard and Prey Management) | | | | |
| 1 | Assessing socioeconomic status of the Indigenous local community; A case study from Dzongu in Khanchandzong a Landscape, India | The study was conducted to analyze the socioeconomic status of <i>Lepchas</i> of the <i>Dzongu</i> . The study also represented the current socioeconomic status of the community and the dimensions for the further studies w.r.t to tribe and region | <ol style="list-style-type: none"> 1. Based on the Primary surveys, FGDs and PRA conducted in the study area the authors pointed out the significance of the agriculture and livestock rearing as the driving force for sustaining the livelihoods of the Lepchas. 2. The cardamom being as the main cash provide more benefits to the local farmers in comparison to other crops i.e. ginger and orange. 3. There has been significant increase in production of ginger in the area and has shown positive trend 4. The production of rice has shown significant decline due to high investment and low production 5. Unavailability of seeds, diseases, infestation of red ants are the main problems faced by farmers 6. Among the most profitable crop, ginger and cardamom ranked highest followed | Jhony Lepcha, Sheila Sinha, Kialsah Gaira and HK Badola (2017) |

| | | | | |
|---|--|--|--|--|
| | | | <p>by orange whereas all the vegetables occupied lowest rank</p> <p>7. Pig, Hen, goat and cows are other options</p> <p>8. There has been significant reduction in farmer's interest towards the traditional crops i.e. rice, maize, wheat, millets which is a matter of concern in the context of agrobiodiversity.</p> | |
| 2 | Impact of wild prey availability on livestock predation by snow leopard | This study was mainly focused on the effect of frequency and intensity of livestock predation by snow leopard with the variation of wild prey population | <p>1. This study indicates that an increase in wild ungulate population leads to decline in snow leopard livestock predation. That ultimately becomes constant</p> <p>2. The livestock predation increases with increase in livestock density</p> <p>3. Large livestock density and low prey population leads to high livestock predation by endangered snow leopard population</p> | Kulbhushan singh, Stephan M. Redpath, Yash veer Bhatnagar, Uma Ramakrishna n, Vibhav Chaturvedi, Sophie C. Smout, Charu Datt Mishra (2017) |
| 3 | Assessing changes in distribution of the endangered snow leopard <i>Panthera uncia</i> and its wild prey over 2 decades in the Indian Himalaya through interview based occupancy surveys | <p>The study was conducted in Lahaul Spiti areas of Himachal Pradesh. Interviews of local people were taken into consideration to study distribution pattern of snow leopard population and its prey in last few years</p> <p>Authors have studied the pattern of prey distribution in two reference periods i.e. 1985-1992 (when green pea crop were introduced in Lahaul and Spiti and when Lahaul</p> | <p>1. Kinnaur: The major threats identified in study area involved reduced prey population resulted due to local and migratory livestock followed by illegal hunting, illegal wildlife trade by both local as well as immigrant labours and free wandering dogs</p> <p>2. Lahaul and Spiti: reduced prey population have been reported due to migratory livestock and free wandering dogs</p> <p>3. Pangi: Migratory livestock grazing, hunting by the local community and immigrant labors are the major factors</p> <p>4. Overall distribution of wild prey have declined by 8% between two study periods i.e. 1985- 1992</p> <p>5. In Pangi, Lahaul and Spiti Ibex is the only large prey of snow leopard</p> | Abhsihek Ghoshal, YV Bhatnagar, Bivash Pandav, Kaustubh Sharma, Charu Dutt Mishra, R. Raghunath, Kulbhushan Singh, R. Suryawanshi (2018) |

| | | | | |
|---|---|--|---|--|
| | | spiti were opened for tourists) and 2008-2012 | <p>6. Blue sheep occurs extensively and in high density in eastern banks of the spiti river and parts of western river where ibex is absent.</p> <p>7. Patches of high probability of snow leopard were identified and shown in Maps.</p> | |
| 4 | People, Predators and Perceptions; Patterns of livestock depredation by snow leopard and wolves | <ul style="list-style-type: none"> The study focused on reality check on human perception regarding depredation of livestock by the carnivores Identification of key variables influencing livestock depredation using multiple regression and hierarchical partitioning | <ul style="list-style-type: none"> Human perception could be at considerable odds with actual pattern of livestock depredation While using the one on one interaction method to ascertain human wild life conflict additional and independent studies must be conducted to measure such issues Generally, the wild prey population abundance leads to intensify the livestock depredation by snow leopard and wolf population. The relation between the snow leopard depredation of livestock and wild prey abundance may be bimodal. In other words, the livestock depredation increases as the wild prey population increases. | KR Suryavanshi, YV Bhanagar, S. Redpath and C. Mishra (2013) |
| 5 | Living with snow leopard; A pluralistic approach to wildlife conservation | <p>This paper provides brief introduction about the key issues prevailing in snow leopard landscapes especially in the context of HP. This paper have also discussed important issues under the heading:</p> <ul style="list-style-type: none"> 1. People and Pastoralism 2. People and wildlife 3. Attitude towards wildlife; Social carrying capacity | <ul style="list-style-type: none"> There two types of herders in this area, Nomadic and Sedentary. The sedentary grazing is extreme form of the herding. The herders move to high altitudes and low altitudes based on seasons i.e. summer and winters respectively Nomadic pastoralist use two forms of livestock grazing i.e. in first form the nomads move through large areas to graze their cashmere goas and sheep. The herders rotate between one or two areas usually separated by few kilometers. The other form is generally “vertical” in which during summers herders moves from lower to higher altitudes | K. Suryavanshi, 2018 |

| | | | | |
|---|---|---|--|---|
| | | 4. Minimizing impact of pastoralist | <ul style="list-style-type: none"> The paper described the important examples and interventions adopted in different villages of HP like Kibber village, Hikkim where compensations have been provided to community on the occasion of livestock loss The paper have also illustrated the various side effects of overgrazing and possible measure to mitigate the same | |
| 7 | Status report on snow leopard in India | This report presents information on the major biogeographical areas of the Indian Himalayas; the Trans Himalayas. Further, data is given on snow leopard presence and broad information on their habitats | <ul style="list-style-type: none"> The snow leopard habitat in Sikkim and Arunachal Pradesh are small but they are the most potential and secure areas for the snow leopard conservation More studies emphasize with inclusions of trekkers, mountaineers and experience wildlife experts | R.S Chundawat, W.A Rodgers and HS Panwar (2007) |
| 8 | Snow Leopard (Panthera Uncia) surveys in the western Himalayas, India | Surveys were conducted in eight protected areas (3000 m) of Uttarakhand and Himachal Pradesh on the basis of indirect evidence such as pugmark and scat. | <ul style="list-style-type: none"> Survey revealed that livestock depredation (mule, goat and sheep) is the only cause of snow leopard-human conflicts and contributed 36% of the diet of the snow leopard. Also 68.1 of the surveyed area were used for pastoral activities in Uttarakhand and Himachal Pradesh and 12.3 was under tourism, defense and development activities. | Aishwarya Maheshwari , Diwakar Sharma, S. Sathyakumar |
| 9 | The role of incentive program in conserving the snow leopard | | | Charudatt Mishra, Priscilla Allen, Tom McCarthy, MD Madhusudan , Agvaantseren giin Bayarjargal and Herbert HT Prins |

| | | | | |
|----|--|---|---|--|
| 10 | Analysis and Mapping snow leopard habitat in the Sikkim Landscape, India | <p>The author has attempted to study the probability area of snow leopard occurrence in Sikkim.</p> <p>Important maps have been illustrated in the article that could be taken up for further considerations.</p> | <ol style="list-style-type: none"> 1. The Sikkim landscape offers a relatively small but rich habitat for snow leopard, critical to metapopulation connectivity in the Himalayan mountain range (over 1000Km² of breeding habitat and nearly 2000 Km² of dispersal habitat. 2. Transboundary management is the key. Effective corridor management, Human wildlife conflict management is required. 3. The western portion of the landscape is well-protected by Khanchandzonga National Park. The area east of the Teesta River is not well managed and requires attention. 4. The eastern portion of the landscape is subject to higher impacts from the settlements and roads than the western part of the landscape 5. The Sikkim landscape is predicted to be warmer and wetter under a changing climate with severe impacts of snow leopard habitat. These areas will transform from grasslands to favoring forest ecosystems 6. Habitats that are considered resilient to full ecosystem shifts will likely experience effects of climate change resulting from shorter winters | Partha S Ghose, 2017 |
| 11 | Unveiling a wildlife haven; Status and distribution of four Trans Himalayan ungulates in Sikkim, India | <ul style="list-style-type: none"> • Authors conducted surveys in trans Himalayan region Tso Lahamo plateau to identify the distribution pattern of 4 ungulate species • The authors have also provided brief introduction about Tso Lahamo plateau | <ol style="list-style-type: none"> 1. <i>Authors have mentioned that Tso Lahamo Plateau is known regionally for its verdant pastures for grazing livestock, its value for threatened wildlife is largely unrecognized and it has not been gazette as protected area.</i> 2. Some of the threats identified by authors to regional wildlife includes presence of fragmented population, transboundary concerns, deterioration of habitats, competition from livestock, diseases (unrevealed) due to frequent interactions | Pranav Chanchani , Gopal S. Rawat and Surender Goel (2010) |

| | | | | |
|----|---|---|--|--|
| | | | with livestock, feral dogs, tourism, roads and disturbances (Provided under table 5) | |
| 12 | Does livestock benefit or harm snow leopard? | This article illustrated the interrelationships in between the wild prey populations, livestock densities and snow leopard habitat use | <ol style="list-style-type: none"> 1. In absence of snow leopard disturbance the productive habitats with healthy wild prey populations seems to be suitable for snow leopard even after the excess livestock 2. After a certain threshold of livestock the wild prey population densities decreases as the anthropogenic pressure and competition increases. 3. Continued co-existence between people and snow leopard is possible till a particular threshold where the livestock and associated anthropogenic pressure do not affect the wild prey population. | Rishi Kumar Sharma, Yash Veer Bhatnagar and Charudutt Mishra, 2015 |
| 13 | Conflicts between traditional pastoralism and conservation of Himalayan ibex (<i>Capra sibirica</i>) in the Trans-Himalayan mountains | The authors estimated the influence of the spatial distribution of livestock on habitat and diet choice of ibex by examining their co-occurrence patterns in cells overlaid on the pastures | <ol style="list-style-type: none"> 1. Ibex, free ranging horses and goat/sheep utilize the same habitat properties and do not differentiate in their diets 2. <i>Migratory goat/sheep impose resource-limitation on ibex</i> and such multiple-use is not compatible with ibex conservation in Pin Valley 3. The issue of migratory grazing must become an urgent concern of conservation management in Pin Valley 4. Livestock, however, currently do not impose serious resource limitations on ibex since most species show habitat separation, while horses are relatively few and are declining in number. | Sumanta Bagchi, Charudutt Mishra and Y. V. Bhatnagar |
| 14 | Role of incentive programs in conserving the snow leopard | This paper have elaborated two major incentive programs and their impact on the snow leopard conservation | <ul style="list-style-type: none"> • Centrally administered programs focusing on forcing to attain conservation goals have limited applicability in areas owned by traditional communities • Without any tangible economic returns, communities are less willing to participate in conservation programs • Curtailing retaliatory killings and restoring wild prey populations are the most | Charudatt Mishra, Priscilla Allen, Tom McCarthy, M.D Madhusudan , 2016 |

| | | | | |
|----|---|---|--|-----------------------|
| | | | <p>important conservation needs of the carnivores today</p> <ul style="list-style-type: none"> • In Spiti the increasing incidences of snow leopard human beings conflicts have been resulted due to relatively large population of wild prey and <i>poor antipredatory livestock management</i> • The value of livestock lose by family is almost half of the average per capita income • Most of the existing compensation schemes are ineffective as a result of the <i>bureaucratic apathy, time and cost involved in securing the compensation and low compensation rates</i> • Locally Managed Communal Insurance Program (2002): It is one the important initiative funded by NCF in an attempt to minimize the dependence on local grazing area. • Snow leopard enterprise (SLE) Program in Mangolia is the program for the enhancing snow leopard population in the region. The SLE signed a contract with local people for value addition to their products and buys back the manufactured products, and further bonus amount were provided to community for their conservation efforts. In return the community commits themselves for the conservation of the snow leopard in the region. | |
| 15 | Has the Community based livestock insurance scheme minimized human snow leopard conflict in Kanchenjunga Conservation | The objectives of this study was to understand the livestock depredation intensity by snow leopard and examine the results of community based livestock insurance program | <p>As per the results obtained based on one on one interview with the herders, the performance of the insurance scheme has not been up to the mark. The following are reasons behind this finding:-</p> <ol style="list-style-type: none"> 1. Ineffective network of verification 2. Lack of representations from community in the committee 3. Insufficient compensations | Ramesh Paudiyal, 2010 |

| | | | | |
|----|--|---|---|--|
| | Area of Nepal Himalaya | | 4. Poor and tedious procedure of processing compensations. | |
| 16 | Snow Leopard, local people and livelihood losses | The article describes key outcomes of a meeting organized by The Mountain Institute and International snow leopard trust. | Based on the recent killing in the areas and downfall of the compensation scheme, the main outcomes was- 1. Preparation of efficient corals to stem further loss of livestock. | Rodney Jackson, 1999 |
| 17 | Ecology and conservation of ungulates In Tso lhamo , north sikkim | This essay delineates habitat use and food section of the region's four wild ungulates - Tibetan argali, Tibetan gazelle, Kiang, and Blue sheep as well as its seasonal population of domesticated yak and sheep; and it graphs select interactions between and among all these species | 1. Tso Lhamo, which lies mostly at an altitude of over 4500 meters, remarkably contains more than sixty-five glacial lakes, twelve glaciers, and four peaks that rise above 6700 meters. These are Mount Paunhunri (7125m), Mount Chomo Yummo (6829m), Mount Khangchengyao (6889m) and Mount Gurudongmar (6715m) 2. <i>This region has its origins in the prehistoric Sea of Tethys. Evidence of its watery origins survive today in the persistence of the brackish Gyamtshona lake and in fossils of oceanic mollusks which lie scattered on slopes and in gullies</i> 3. Tso Lhamo is home to a number of species that are listed as 'endangered' (schedule I) in the Indian Wildlife Protection Act (IWPA). 4. Currently, these herders migrate to the Tso Lhamo cold desert with its limited snow-cover in October-November and return to their summer ranges in the adjacent Lasher-Giagong regions by early May. This system ensures a sustainable use of the grassland and provide healthy habitat for the prevalent species in this area. 5. The presence of army in the area has restricted the entry of casual visitors, tourists and livestock grazers the army is refraining from hunting and is committed to preventing from | Pranav Chanchani, G.S.Rawat and S.P.Goyal (<i>Publication year not mentioned</i>) |

| | | | | |
|----|---|--|--|---|
| | | | <p>Others from doing so.</p> <ol style="list-style-type: none"> 6. The development of infrastructure by army has been observed in area in form of roads, paved and unpaved roads. 7. The authors have also recommend that some critical wildlife habitats areas - most notably the Mirdo Kongra La valley, the Chomodo Bamcho La region, and the Oloten Sese La region up to the Teesta Khangste Glacier be protected from heavy grazing and undue anthropogenic pressures. | |
| 18 | Overstocking in the trans-Himalayan rangelands of India | The authors have attempted to study the correlations of fecundity of adult female livestock to total livestock biomass density in Spiti District of Himachal Pradesh | <ol style="list-style-type: none"> 1. The authors based on their standard models concluded that there is inverse correlation between fecundity and livestock. 2. Being an agro-pastoral system as against a purely pastoral one, maximizing milk or meat production is not the only objective of livestock rearing in Spiti. Livestock are also needed for ploughing fields (yak and dzo), as draught animals (donkey), and for producing dung used as manure and fuel (all species). Furthermore, high levels of livestock loss to wild predator's means that a relatively larger livestock holding is required to maintain herd constancy at the family level. Rertrtrtr1` | Charu Datt Mishra, Herbert Prins, Spike Wieren (2001) |
| 19 | Snow leopard; conflict and conservation | This article deals with the key issues and desirable actions for the conservation of snow leopard | <ol style="list-style-type: none"> 1. Lack of enforcement of management strategies and plans, lack of awareness, political will, and lack of fund are the some of the key issues for the same. 2. Livestock depredation by the snow leopard is the main cause of the snow leopard-Human conflicts 3. Irregular proportion i.e. low proportion of livestock to wild prey is mainly responsible for the conflicts. 4. Offsetting the loss of the livestock by the snow leopard is a must for increasing | Rodney M. Jackson, Charudatt Mishra, Thomas M. Mc Carthy and Som B. Ale |

| | | | | |
|----|--|--|--|--|
| | | | <p>tolerance towards the wildlife since, the Wild life depredation is a constant factor</p> <ol style="list-style-type: none"> 5. Instead of Guns and Fences approaches there is a need of implementing the participatory approach for the conservation of snow leopard 6. There is inherent requirement for a mechanism to monitor the snow leopard and its population. | |
| 20 | Grass-root measures to Protect the Endangered Snow Leopard from Herder Retribution: Lesson learnt from Predator-Proofing corrals in Ladhak | This paper describes community based initiatives being undertaken in India's Hemis National Park aimed at predator proofing livestock corrals and encouraging local herders to become more effective stewards of the snow leopard, its prey and Habitat | | Rodney Jackson, Rinchen Wangchuk and Darla Hillard |
| 21 | Protected areas and snow leopards: Their distribution and status | This paper describes community based initiatives being undertaken in India's Hemis National Park aimed at predator-proofing livestock corrals and encouraging local herders to become more effective stewards of the snow leopard, its prey and habitat | <ol style="list-style-type: none"> 1. Highly participatory, 4 step process known as Appreciative Participatory Planning and Action Plan (APPA) provides the primary mechanism for assisting communities to develop Action Plans to reduce livestock depredation losses, increase in household income and strengthen environment stewardship 2. APPA comprise of following 4 D's i.e. Discovery, Dreaming, Design and Delivery (Identification of root cause, participants vision, devise actions and implementing actions respectively) 3. The benefits of APPA are as follows- <ul style="list-style-type: none"> • APPA is a the most cost effective option for reducing livestock depredation • Community participation process provides most efficient results • By providing predator proof corrals, chances of 5-10 snow leopard from high | Michael J.B Green |

| | | | | |
|----|---|--|---|--|
| | | | <p>risk of retaliatory killings could be minimized</p> <ul style="list-style-type: none"> • Solutions could be simple and cost effective (e.g livestock pens) • Externally driven initiatives fails to achieve their goals • NGOs are effective mediums for facilitation of conservation programs | |
| 22 | A community based approach to mitigate livestock depredation by snow leopards | <p>The article describes a community based conservation initiative to address the problem of livestock depredation in Hemis National Park</p> <p>The authors have used AAPA as the mode of ensuring extensive community participation in decision making process</p> | <ol style="list-style-type: none"> 1. The results of this study indicates that by encouraging the predator proof livestock pens, enhancing household incomes in environmentally and culturally suitable ways, livestock depredation and Human wild life conflicts could be minimized | Rodney Jackson and Rinchen wangchuck, 2004 |
| 23 | National snow leopard ecosystem protection priorities, India | Author has elaborated the key issues in conservation of snow leopards in India. The authors have also elaborated the key aspects of the Project Snow Leopard implemented in India | <ol style="list-style-type: none"> 1. Conservation of snow leopard is being challenged by both traditional and modern threats. 2. The prominent threats includes conflicts from herders, poaching for bones and skins, reduction in prey population, habitat degradation due to anthropogenic pressure, shortage of trained frontline staff, strong communication strategy, poor infrastructure and logistic support and science based information for adaptive management. | NA |
| 24 | Managing people-wildlife conflict on Alpine Pastures in the Himalaya | This paper summarizes the methods used and results obtained and provide a “tool box” for simple participatory technique and project planning criteria that could be applied to the | <ol style="list-style-type: none"> 1. Increasing vehicular access has resulted in more penetration and use of uninhabited and very remote rich wildlife areas. 2. Protected area and the allied welfare of contained wildlife population will be at greater risk of loss with continued loss of crops and livestock which is a rapidly | Rodney Jackson (year not mentioned) |

| | | | | |
|--|--|------------------------------|--|--|
| | | problem throughout Himalayas | <p>emerging as leading source of conflict between human beings and snow leopard.</p> <ol style="list-style-type: none"> 3. Predators are frequently blamed for the loss actually resulting from other source of mortality such as diseases, consumption of poisonous plants, or accidents. 4. Generally losses occurs more in winters and springs 5. Protected area management can be only effective if and only the basic concern, needs and aspirations of local people are addressed, in parallel with those of wildlife. 6. Natural prey base need to be enhanced so that dependency of Snow leopard on domestic livestock is reduced and conflicts could be reduced. 7. Additional factors involves erosion of traditional knowledge, reduced herder vigilance,, increased livestock numbers and changes in animal husbandry systems 8. Livestock depredation is generally not evenly distributed, but rather associated with the nearby presence of cliffs, rocky areas and good cover 9. Snow leopard which brings their cubs to a kill may be reinforcing the takings of livestock as prey, while <i>the tendency of snow leopard to remain at a kill and consume all available meat increases their vulnerability to human retribution.</i> 10. Authors recommended the following criteria's for the management plan <ol style="list-style-type: none"> 1. Environmentally sound 2. Economically sustainable 3. Socially responsible 4. Embedded with clear responsibilities and transparent budget allocations 11. <i>As an internationally recognized, the snow leopard may serve as a barometer for measuring the environment health</i> | |
|--|--|------------------------------|--|--|

| | | | | |
|------------------------------|--|---|--|-----------------------------------|
| | | | <p><i>and possibly as indicator alpine biodiversity.</i></p> <p>12. Few points that could be adopted in drafting must include preventive as well as remedial measures that includes-</p> <ol style="list-style-type: none"> Improving guarding of livestock Encouraging communities to hire skilled shepherds Including improved breeds of guard dogs Creating core zones for snow leopard and their prey Assisting herders by proving alternative livelihoods Offering incentives Transparency in filing claims due to livestock depredation | |

| 25 | Transhumance, livelihood and sustainable development and conflict between formal institution and communal governance: An evaluative Note on East Himalayan state of Sikkim | Through this article attempt has been made to study the transhumance activity known as "Gothwala system" as a way of securing livelihood which is prevalent in Lachung Valley of North Sikkim. The article deals with the conflicts conflict of Dzumsa towards managing forest and fodder in a sustainable manner and act implemented by Government of Sikkim that tends to demolish this system. | <ul style="list-style-type: none"> Temporary / permanent cattle shed made up of locally available forest material is known as <i>goth</i>. The local people using goth are known as Gothwala Dzumsa is a traditional governance system which is almost 200 years old Ground observations have revealed the following negative impacts of banning the pastoral activities in Lachung valley- <ol style="list-style-type: none"> Gothwala are selling their livestock as there is prohibition of grazing activities People are now working as wage laborers. Lack of use of cow dung is leading to loss of organic tradition People are not getting sufficient meat supplies Negative impact on fodder supply | |
| 26 | Pastures and Forages in North Western Himalayas | This paper represents the status of status of pasture and forage in North Western | 1. Total annual requirement of green and dry fodder in Himachal Pradesh is about 6206000 and 19838000 tons respectively which is against the availability in the state | Sudesh Radotra, Inder Dev, Suheel |

| | | | | |
|----|---|--|--|-----------------------|
| | Region: Current Status and Future strategies | Himalayan Region with special emphasis on Himachal Pradesh | <p>i.e. 3145000 and 5298000 tons respectively</p> <ol style="list-style-type: none"> 2. In Himachal Pradesh 15,18,030 ha of land in the state is covered under pastures and grasslands which is 35.44 % of the total area. 3. Chamba district has higher fodder availability followed by Kangra and Mandi 4. Considerable gaps are present in policy, administrative and research frameworks required for the strengthening rangeland resources 5. Absence of pasture management and grazing policy at national and state level have rendered the pasture lands in to grazing pastures 6. There is no designated agency to steer the management of grazing lands and fodder resources. This has resulted in land use agencies and research organization implementing their own agenda for the management of grazing lands. 7. There is acute deficiency of fodder for livestock, and further fodder development on grazing land has not been encouraged 8. Where livestock depends heavily on grazing forage availability is not encouraging 9. There is no grazing management plan available as for now which must be planned with the proper participation of communities 10. Most of the research studies pertaining to grassland and pastures are fragmented and are difficult to apply on large scale. | Ahmad, A. Kannan |
| 27 | Shift from transhumance and subtle livelihood patterns of the <i>bhotia</i> | This paper highlights the need assessment of conservation efforts pertaining to Tibetan sheep population | <ol style="list-style-type: none"> 1. Tibetan sheep has been a major source of livelihood of majority of populations. The younger generation has been now started to shift towards the alternate source of livelihood | Sandip Banerjee, 2009 |

| | | | | |
|----|--|---|---|---|
| | community and its impact on Tibetan sheep population in Sikkim | | <ol style="list-style-type: none"> 2. Lack of access to grazing land is leading to decline in proper food availability to sheep 3. Lack of fodder results in mortality among the sheep population. This has resulted in financial distress amongst the livestock grazers 4. The woolen carpets produced by the traditional craft person are finding fewer buyers. These carpets are being replaced by synthetic woolen carpets 5. In order to revive the old traditional sheep rearing there is a need to rejuvenate market channel and production channels. 6. Other recommendations are- <ul style="list-style-type: none"> • Generation of self-employment opportunities • Integration of medicinal plant • Encouraging breeding practices • Wise adaptation of crossbreeds • Multidisciplinary approach from various organizations • Establishment of community level fodder depots | |
| 28 | A note on transhumant pastoralism in Niti valley, western Himalaya, India | | | Moonideepa Mitra, Amit Kumar, Bhupender S Adhikari and Gopal S. Rawat |
| 29 | People's opinion on the impacts of Ban on Grazing in Barsey Rhododendron Sanctury, Sikkim, India | This paper represents the impacts of banning the grazing in Barsey Rhododendron sanctuary. The main objective of this study was- 1. Assessing pastoralism system | <ol style="list-style-type: none"> 1. Before banning the grazing the area around the cattle shed became barren due to trampling and overgrazing 2. Availability of medicinal plan got reduced due to overgrazing 3. Due to competition with livestock wild animals also became very scarce 4. The process of phasing off the pasture were highly participatory in which small meeting were organized and community | Sandeep Tambe and Nima Tashi Bhutia and Murrari Arrawatia (2005) |

| | | | | |
|----|---|---|--|--|
| | | <p>2. To elaborate the process of offsetting herding practice</p> <p>3. People's perception of making barsey sanctuary "cattle free"</p> | <p>perception were recorded for the responsible factors causing overgrazing</p> <p>5. Awareness programmes, audio visuals show and nature games were organized in order to aware local community people</p> <p>6. Forest officials, locals were allotted with responsibilities for monitoring the ban enforcement</p> <p>7. Implementation of eco-development policy in the state enabled the state to regulate the eco development committees (EDC). Through Eco development policy community were provided with rights to prepare their own core of conduct</p> <p>8. The government also assisted the herders who phased out their cattle voluntarily and in a timely manner</p> <p>9. 91% of the herders perceived positive impacts from a well settled life in the village. They have a better social life, their farm has better availability of manure and their children have access to formal education</p> <p>10. The positive impact on the Barsey is better natural regeneration of forest, more biomass, rejuvenation of springs and increase in wild life population</p> | |
| 30 | Indigenous knowledge on bio resources management for the livelihood of the people of Sikkim | This article provides the past and existing farming and agriculture system in Sikkim | A total of 15 indigenous system of farming has been documented in this document | JR Subba, 2008 |
| 31 | Sustainable livelihoods for high altitude mountain communities case studies | This article provides the information regarding the main constraints to development of local communities residing in Himalayan Landscapes | 1. The main issues in front of developing communities socioeconomically are:- Geographical, remoteness, poor basic infrastructure, inequality of exchange, non-participation in community events due to geographical limitation | Gargi Banerji and Mashqura Fareedi (Date Not available) |

| | | | | |
|----|--|--|---|--|
| | from the Himalayas | | <p>2. The two key principles followed in this development strategies are :-</p> <p><i>Endogenous development</i></p> <p><i>Development cum conservation</i></p> <p>3. The key opportunity and options available are:-</p> <ul style="list-style-type: none"> • Alternate occupation • Value addition • Niche sector clusters <p>4. A five step methodology could be adopted to develop livelihood development :-</p> <ol style="list-style-type: none"> 1. Assessment and design 2. Capacity Building 3. Planning 4. Collaboration and development (Networking) 5. Upgradation (cluster development and market linkage) | |
| 32 | Non-Farm based livelihood in Rural Sikkim; an analysis | This paper provides situation of non-farm livelihood in rural Sikkim | <ol style="list-style-type: none"> 1. The non-farm livelihood activities occupies highest share in household income in most of the household 2. The main cause of this finding is attributed to average income of households, average education, credits and finance and Family size 3. The majority of the nonfarm activities are in existence for the period of less than 8 years. The main reason of this finding is attributed to introduction of MGNREGA scheme. 4. The scale of nonfarm activity is very small and therefor the opportunities are very less. 5. Apart from government, private and business other modules have not developed and therefore are limited in their human resource 6. Due to sparse population, enterprise formation is not very lucrative, thus enterprise have to be urban dependent and makes it seasonal. | Santosh sharma, Rajendra Mistri and Manesh Choubay, 2017 |

| | | | | |
|----|--|---|---|-----------------------------------|
| | | | 7. The dearth of skills and capital among people makes non-farming activities less lucrative. | |
| 33 | Agricultural transformation in Trans Himalayan region of Himachal Pradesh: cropping pattern, technology adoption and emerging challenges | This paper on agricultural transformation has studied changes in cropping pattern, adoption process of new technologies, sources of information about new technology and emerging threats to the existing cropping pattern in Lahaul spiti district of Himachal Pradesh | <ol style="list-style-type: none"> 1. The significant drivers of enhancing crop diversity were improved road connectivity and better means of transportation 2. <i>There has been decline in demand of traditional crops like black pea, barley and local wheat due to changing food habits</i> 3. The availability of hybrid seeds, chemicals and fertilizers also enhanced the change in cropping pattern 4. Emergence of new markets has facilitated marketing of produce and fetching higher price, especially for green peas 5. Continuous technological innovations in terms of latest technologies of packaging and practices, development of disease resistant varieties are responsible for promoting economic viability and sustainability in Himachal Pradesh. | H.R Sharma and S.K Chauhan (2013) |

Annexure-4:

Policy Gap Sheet:

| S. No. | Legislation/Policy | Brief Description | Gaps and Issues |
|--------|---|--|---|
| 1 | Organic Farming Policy of 2010 | To promote organic farming sector by developing appropriate plans, support services, supply chain, marketing, investment environment and organic agro tourism. | Lacks a comprehensive certification mechanism and supply chain and marketing strategy. Lacks strategy to lessen chemical use. |
| 2 | HP Forest Re-Revised Eco-Tourism Policy of 2017 | Work towards conservation of natural resources and sustainable development and opportunities to enhance livelihood of local people. | Implication of tourism on the protected areas. Management of vehicular traffic. |
| 3 | HP Medicinal Plant Sector Policy of 2006 | Recognizes medicinal plant resources as important forest produce, source of livelihood, and contributor to state's economy. Develops institutional and legislative mechanisms to develop the sector. | Policy implications of developing medicinal plant areas on and around Protected Areas. |
| 4 | State Policy on Payment for Eco-System Services, 2013 | For sustainable production of ecosystem services; generating economic incentives to community for conservation. | Implementation??? |
| 5 | HP Skill Development Policy of 2016 | The policy recognizes the need to empower the individuals to enhance learning and lifelong employment opportunities to increase the productive wage force of the state. | Assurance of providing jobs after training is absent. Monitoring procedures are also lacking. |
| 6 | Indira AwaasYojana(IAY) | To provide the rural-poor living below the poverty line with financial aid for the construction of the house. | Lack of transparency in selection of candidates, low quality of houses, lack of technical support, weak mechanism for monitoring. Loans are not available by beneficiaries. Lack of |

| | | | |
|----|--|---|---|
| | | | convergence between different programs. |
| 7 | Rajiv AwaasYojana (RAY) | On the analogy of IAY. | On the analogy of IAY. |
| 8 | HP Rural Employment Guarantee Scheme of 2006 | Under the scheme applicants are entitled to 100 days of guaranteed employment in the financial year. | Lack of transparency in selection of candidates. Lack of convergence between different schemes and programs. |
| 9 | Scheduled Tribes and Other Traditional Forest Dwellers (Recognition of Forest Rights) Rule, 2008 | Talks about granting the right to land where scheduled tribes and other forest dwellers have been living and practicing their livelihood. They need to provide the evidence for the claiming of the land. | No special provisions for the land that is falling under or intersecting with protected areas. No conflict solving regulation where two claimants claim the same piece of land. |
| 10 | Border Area Development Programme (BADP) Guidelines, 2015 | It aims to cover all the special development needs and well-being of the people living near international borders in inaccessible areas and provide them with the basic infrastructure through the convergence of various schemes and participatory approach. | Environment??? |
| 11 | Compensatory Afforestation Fund Act of 2016 | Fund is provided for assisted natural and artificial regeneration, protection, management and conservation of the forest. It also works towards improved wildlife habitat, capacity building and monitoring. | Community access to natural reservoir is not mentioned. Eradication and monitoring of weeds are absent. |
| 12 | HP Forest Sector Policy and Strategy of 2005 | Aims to achieve sustainable forest management. It also works towards maintenance and rehabilitation of its environment and enhanced livelihood opportunities of the people. | Grazing regulations for local glaziers are absent (available grazing ground is less than required grazing ground). No policy regulation for high-range pasturelands. No regulations for cultivation and trading of threatened MAPs. Lack of research on linking the climate change with change in forest. |

| | | | |
|----|---|---|--|
| 13 | HP Participatory Forest Management Rules of 2000 | Talks about managing a selected area jointly by the Society and the Department based on the terms and conditions of the agreement between them. | No transparency on how the funds and yield are being used and distributed. No implementation, assessment and monitoring framework. What are the criteria for announcing an area under PFM? |
| 14 | Rules regulating the Grant-in-Aid to the village forest department Societies and the PFM scheme | Aims at achieving the objectives of PFM and its implementation. | Assessment and monitoring frameworks are absent. |
| 15 | Sanjhi Van Yojna | The main objective is the regeneration of the degraded forest area, conservation and sustainable use of forests through community participation. | No methodology for implementation, monitoring and assessment. No transparency in distribution of income. If the area is being used for plantation, then what about flora and fauna already exists there? |
| 16 | Rules regulating the Grant-in-Aid to the village forest department Societies and the SVY | Aims at achieving the objectives of <i>SanjhiVanYojna</i> and its implementation. | Methodology for assessing the use of sanctioned grant and transparency while sanctioning the grant is absent. |
| 17 | HP State Rural Livelihood Mission. | It aims at poverty alleviation through social mobilization, institutions and capacity building, financial inclusion, skill generation and a portfolio of sustainable livelihoods. | No indication if it is reaching the high-rangelands. No transparency in selection of SHG for investment, assessment and monitoring. |
| 18 | MukhyaMantriYuvaAajeevikaYojana, 2018 | To promote self-employment opportunities and provide livelihood to local youth by encouraging local entrepreneurship. | No transparency while choosing the business to invest. |

| | | | |
|----|---|--|--|
| 19 | HP Sustainable Tourism Development Policy of 2013 | It aims at making HP a leading global sustainable tourism destination and makes it a primary source of socio-economic growth in the state. | Monitoring criteria is not clear and no transparency while choosing the business for investment. |
| 20 | Efficient irrigation through Micro-irrigation Systems Project, 2016 | It promotes equitable water distribution by using efficient irrigation systems. | No transparency in monitoring. No provision of capacity building. |
| 21 | Assistance to Women for self-employment Rules of 2005 | It aims at aiding women to set up their own business trade in order to earn their livelihood. | No transparency while selecting the business. No monitoring system. No indication if it is accessible to high rangelands. |
| 22 | Policy for Project Staff engaged under the HPMHWDP, Swan River Project, Kandi Project I&II and Indo-German Changer Project. | The policy is for the Project Staff who have been working on the mentioned projects on full-time basis and needs to be re-engaged and re-appointed under other societies, departments or projects. | |
| 23 | The Scheduled Castes and Scheduled Tribes (Prevention of Atrocities) Rules, 1995 | Provisions set up to prevent any atrocities towards Scheduled Castes and Scheduled Tribes and to bring justice to them if any atrocity has been committed. | There are no Special Courts, Special Police Stations; Surveys conducted to assess the working of the Provisions of the Act, legal Aid set up to help the victims of the atrocities. The Modal Contingency Plan is still under consideration. |
| 24 | HP State Water Policy of 2013 | It talks about equitable and systematic distribution and usage of water, public awareness about conservation and maintenance of water quality. | Why the irrigation potential has not been reached till now and how to do it? No news regarding water adalats. Economic value (tariff) for the resource is not adequate, which may lead to overutilization. |
| 25 | HP Rural Employment Guarantee Scheme of 2006 | It aims at guaranteed 100 days of employment in a financial year in terms of households. | People get paid even if they are not working or the project is not completed within the timelines. Who is accountable for this? Not all people belong to same economic strata, so who should get the benefit? |

| | | | |
|-----------|---|---|--|
| 26 | Guidelines for National Lake Conservation Plan | It uses an integrated ecosystem approach to restore and conserve the lakes of India which have been degraded due to waste water discharge. | No implementation and monitoring criteria. No strict provision regarding solid waste management and dhobi ghats. |
| 27 | Rural Housing Interest Subsidy Scheme (RHISS) Guidelines of 2017 | Aims at providing pucca house with all basic amenities to all houseless and households living in kutcha houses by 2022. | No transparency in selection of candidates. Monitoring procedure is not specified. |
| 28 | Guidelines for Declaration of Eco-Sensitive Zones Around National Parks and Wildlife Sanctuaries (2011) | Areas around National Parks and Wildlife Sanctuaries are of high biodiversity significance, so they also need to be conserved. | Verification, implementation, management and monitoring criteria are absent. |
| 29 | National Conservation Strategy and Policy Statement on Environment and Development. | The purpose is to include and reinforce our traditional ethos and to build up a conservation society and making efficient use of resources. | Responsibilities of central, state and local governments are not clearly identified. Enforcement mechanism for employing tools and techniques (EIA) and implementation methodology for several key sectors are absent. Mid-term assessment of policy is absent |
| 30 | Guidelines on State Compensatory Afforestation Fund and Planning Authority (State CAMPA) | It is an instrument to accelerate the activities for preservation of natural forests, management of wildlife, infrastructure development in the sector and other works. | How are the communities living in the area are being involved and incentives and rewards awarded to them? |

Annexure-5:

Proceedings of the First Stakeholder Workshop on Participatory Integrated Landscape Level Management Strategy and Plan for the Lahaul-Pangi Snow Leopard Landscape

Date: 4th July 2019

Time: 09:30.A.M to 04:30.P.M

Venue: Hotel Marina, Shimla, HP

The Agenda of the Workshop and List of Participants are in Annexure-1 and 2 respectively.

A. Welcome Remarks

Dr Jagdish Kishwan, Chief Advisor, GICIA India Pvt. Ltd. and Project Lead, UNDP Integrated Landscape Project

Dr Jagdish Kishwan, Chief Project Advisor welcomed all the participants. He extended his thanks to Dr Savita, IFS, PCCF (WL) & Chief Wildlife Warden, HP Forest Department and Dr Ajay Srivastav, IFS, Addl. PCCF (WL) cum State Nodal Officer for sparing their time to attend the first stakeholder workshop organized by GICIA. He gave the overview of the process of preparation of participatory integrated landscape-based strategy. He informed that GIPL and all the consortium partners have been working in the landscape area for last 6 months through their field survey teams and State Project Officer Mr Sudhanshu Arjeria. He informed that a total of 35 villages have been covered in the Lahaul-Pangi landscape by field teams of the GIPL. These teams have gathered a lot of information pertaining to conservation and development of snow leopard landscape area through FGDs, questionnaires-based survey and secondary literature review pertaining to the landscape.

Dr Savita, PCCF (WL) and Chief Project Director, SECURE Himalaya

Dr Savita, Chairperson of the SLTC & State Project Director introduced the participants about the ongoing activities under the SECURE Himalaya Project. She emphasised that amongst all the studies commissioned by the UNDP, preparation of participatory and integrated landscape-based strategy and plan holds the key to integrate all the line departments and their policies to work in tandem for the purpose of conservation and management of Snow Leopard Landscape in Pangi-Lahaul area.

Dr Savita, further focussed on the need of stakeholder dialogue and justified the necessity of carrying out frequent stakeholder consultations to prepare a rational strategy by integrating mandate of conservation of biodiversity of landscape with focus on securing community rights and local livelihoods for the larger agenda of SL Landscape conservation.

For the preparation of Strategy and Plan, she emphasised the use of standard reference documents, like the Sawarkar Guidelines.

Dr Ajay Srivastav, IFS, Addl. PCCF (WL) cum State Nodal Officer, SECURE Himalaya

Dr Srivastav explained the need of landscape vision while integrating the existing strategies, plan and schemes of different department and agencies. He emphasised on the need of converging different department and frameworks that will ensure the role of multiple stakeholders while mitigating the existing challenges pertaining to conservation and management of SL Landscape area. In this context, he gave example of viable collaboration between Forest Department and Animal Husbandry Department for vaccination of livestock on the fringes of PAs.

Mr Pankaj Pant, Manager, GICIA

Mr Pankaj Pant elaborated the objective of GIPL-UNDP Project. He also explained details of issues like overgrazing, livestock depredation, waste management, connectivity, and livelihood improvement identified during their primary and secondary studies.

Key Discussions:

Human Wildlife Conflict and Overgrazing:

- Growing livestock population is leading to overgrazing and competition with SL prey base. This competition is not limited to livestock only.
- Dr Ghoshal emphasized that overgrazing is not only degrading the landscape but also the health of animals like sheep, which face problems like low milk production and unhealthy progeny.
- Dr Srivastav informed that local community has rights of grazing in the landscape, and at present impact of tourism is low.
- Dr Jagdish Kishwan informed that issues of overgrazing and excess population of livestock may not be a major problem right now but this may affect the ecological balance of the landscape in future. Grazing rights and number of animals permitted should be closely regulated to keep a check on the situation.

- Mr. Dem Chand, local representative from Pangti informed that in Pangti, Human-wildlife conflict is a major issue. People spray poison on carcasses, and leave these in forest for Snow Leopard to feed that results in the predators' instant death. They also use traps to kill bears. Monkey population is also increasing and they feed on crops. The Local Communities are now more interested in rearing cows and ox rather than sheep.
- Mr Dem Chand further inquired, if killing monkeys could be permitted to save crops of locals. In response, Mr Dhaulta (DFO Wildlife, HQ) informed that as per latest circulars of HP SFD, monkey has not been declared as vermin in Pangti, and, therefore, it's killing presently is not permissible in Pangti. But the department can always consider request of the local communities of Pangti.
- Mr Tog Chand, local representative of Lahaul highlighted the issues like overgrazing and HW conflict are almost absent in Lahaul District.
- Dr Srivastav opined that pastoralism is on a decline in HP, and a few migratory graziers move to high rangelands for livestock grazing (*Gaddis* from Churah).
- Earlier local community used to be involved in regular patrolling but of late the traditional system has broken down, and now locals do not come forward for the purpose.
- Dr Minhas, Chairman HIMOARD stated that smuggling of wild animal parts for commercial gains is also emerging as an issue and needs immediate attention.

Tourism:

- Dr Srivastav suggested that tourism should be promoted as "Eco-tourism" or "Nature Tourism" as HP is more famous for its scenic beauty. To this Dr Kishwan explained that tourism and Eco-tourism are different entities and are under jurisdiction of different line departments, the convergence for which is a huge task, but there is need to synergise the actions and policies of the two departments.
- Activities for eco-tourism and wildlife tourism should be diversified and should be made more sustainable with benefits majorly flowing to the local communities.

Livelihood:

- Dr Minhas, HIMOARD suggested that the participation of local artisans should be highlighted rather than the schemes. Exposure should be given to them at International Exhibitions like "BioFach"
- Value addition activities like designing, packaging and branding can help local artisans to grow and promote their trade.
- People have excess raw material like wool but appropriate price and market procurement of the same are an issue.
- Mr Dem Chand informed that there is lot of potential in trading of Janglee Lahsun (*Allium spp*) and Jungle Tulsi (*Ocimum basilicum*).

- Duplication of handicraft products is a serious concern as outsiders mass produce duplicates of the local craft, and sell it under false local brand. To this, Dr Ghoshal suggested that strategic marketing should be adopted through which product identification and marking, like providing of holograms, could be emphasised. He further suggested that, to integrate snow leopard conservation with livelihood improvement, NCF Enterprise Programme in Spiti Landscape could be referred to for guidance.

Unsustainable trade of Natural Resources:

- Local community representatives from Lahaul and Pangri informed that Illegal extraction of MAPs is taking place in Pangri by outsiders from Churah (Tindi Panchayat).
- Mr Tog Chand from Lahaul inquired if through the help of *Mahila* and *Yuvak Mandals* they can intercept defaulters passing through their village who illegally extract MAPs. To this Mr Dhaulta, DFO, WL, responded that perhaps State Biodiversity Board could guide in this matter. Dr Kishwan suggested that this issue can be flagged under legal and policy gaps.
- Mr Tog Chand also inquired whether they could take up Forest Land for MAPs plantation. Dr Srivastava suggested that it may be possible but for community only, not for individuals. He also invited proposal for it.
- Kuth and other medicinal spp plantation are present but lack marketing strategy. Proper awareness and capacity building of locals is required for this purpose.
- Middlemen, who buy the product from farmers at low price, sell it at a much higher price in the market, cornering the major part of profit from the produce. Thus, with the present system of middlemen there is no significant improvement in farmers' income.

Waste Management:

- Dr Ajay Srivastav told that since there is limited connectivity to the SL landscape, the issue of waste management is not a pressing issue at present. However, the problem of waste management becomes more prevalent during tourist season.
- Dr Kishwan expressed his concerns over problem of waste accumulation along the stream banks in the State, and suggested that continuous monitoring of the Snow leopard landscape was needed to see that the problem of waste management did not become a problem in future. He suggested that the problem of waste management requires a regular check and monitoring.

Feral Dogs:

- Dr Abhishek Ghoshal informed that the problem of feral dogs is very prominent in snow leopard landscape area, mostly in Spiti. He further informed that feral dogs generally feed on refuse and garbage.

- Dr Kishwan pointed out that stray dogs foraging on kitchen and canteen waste of the security forces' establishments in the high-altitude bordering areas were a menace to the prey base of SL.
- Mr Sudhanshu Arjeria, informed that during his visit to Lahaul-Pangi SL landscape area, there has been a decline in feral dog population after being poisoned by the local Communities.
- An incident of an SL cub having been fatally injured by feral dogs in Spiti was mentioned in the workshop.

Migratory Labourers:

- Migratory labour poses a threat as they hunt animals and set up their base in or near forest. Dr Ghoshal mentioned that these labourers also live in difficult situation needing energy food, and their compulsion should be understood before taking actions against them.
- Major concern of the stakeholders was inadequate participation from the government departments especially in consultation workshops. They called for active participation and dialogue from all for framing a converged plan of action.

Suggested Plan of Action:

- Dr Kishwan stated that the problem of inadequate participation of the government departments was a matter of fact, but to overcome this situation, his team had already chalked out a schedule of one-to-one meetings with the concerned departments in next 2 days after the stakeholder workshop¹ to invite suggestions on the draft management strategy and plan.
- To address problem of overgrazing and conflict in the SL landscape, an empowered committee with participation from local community and government departments should be constituted.
- Dr Ajay Srivastav suggested that instead of eco-tourism, nature tourism should be promoted in the SL landscape to promote visitation of scenic places in the high range landscape.
- Capacity building of all stakeholders including government officials and a proper institutional mechanism for the purpose should also be included in the action plan.
- Mr Dem Chand from Pangi suggested that workshops and small meetings should be regularly organised with participations of an active representative from every village in the SL landscape. The villages may be covered in a rotational format.

¹ On 5th and 6th the GIPL team met officials of agriculture, animal husbandry, goat and sheep departments, HIMCOSTE and Wool Federation in Shimla, and collected their views on the Draft Integrated Strategy and Plan for the Pangi-Lahaul SL Landscape.

- Grazing Rights for local and migratory graziers should be critically analysed and regulated.
- Zonation for grazing can be considered to prevent uncontrolled grazing.
- Guidance and assistance from local influential figures like *Lamas* of prominent monasteries should be sought and institutionalized to create awareness amongst local people and to mould their opinion in favour of conservation of landscape along with its biodiversity.
- ***Praja Mandal, Mahila Mandal, Yuvak Mandal and Environment Committee*** can be institutionalised to give more responsibilities as local communities respect and fear their decisions.
- Properly empowered local committees can work with Forest Department for better coordination and management of snow leopard landscape area.
- Dr Kishwan suggested that an internal reporting system should be present in every village to report illegal activities like NTFP extraction and killings.
- People although have constituted BMC but they need to be made aware about the roles and responsibilities of the BMCs along with their powers.
- Dr Minhas, HIMOARD informed about CIH (Confederation of Indian Horticulture) that organises farmer-producer groups to make marketing accessible. Agencies can work with CIH to take advantage of such groups at village level.
- Dr Minhas also informed that Organically Certifying the villages can be helpful as it not only reduces the use of fertilizers and pesticides but also helps in fetching a higher market price for the produce compared to non-certified products. He has already certified 2 villages with coverage of around 5000 people.
- Local storage facilities based on local innovative technologies should be developed in SL landscape villages to prevent glut of products, and to regulate supply of local seasonal products in the markets to enable the local farmers to get a better price.
- GI certification should be considered for locally grown plant species and products. HIMCOSTE can be engaged to help the process as they have already registered (GI tag) a number of local products like Chulli Oil, Chamba Tea, Kala Zeera, etc.
- Dr Abhishek informed that to deal with problem of feral dogs, NCF has installed **Bio-digester modules** in Spiti area, and similar bio-digesters could be installed in feral dogs affected areas of Project SECURE Landscape.
- Dr Abhishek also mentioned about the SL Enterprise programme being implemented by NCF in Spiti (contact person Mr Ajay Bijur), and learning and experience from the same could be made use of, as appropriate, while developing the 'Participatory landscape level integrated strategy and plan' for Pangni-Lahaul SL landscape.
- There should be better awareness about government schemes. Local communities are not well aware of schemes being implemented by government and other agencies for their benefit. Compensation schemes for livestock killed by wild animals of forest department are such examples.
- Incentives should be provided for grooming and encouraging local champions, who should also be recognised. Monetary incentives can also be considered for the purpose.

- Wool Federation, HP can contribute significantly towards the improvement of sheep, vaccination, providing modern tools for shearing and generating market linkage for raw wool.
- Local festivals like *Yatra, Zukaaru and Vindal Sherjach* could be used as a potential platform to showcase the snow leopard conservation and raise awareness about various issues connected with its conservation and management. Local influential personalities, like Lamas, other religious leaders, preachers and other community leaders can be invited in the events during the festivals to give to local communities, the message of conservation.
- Mr Tog Chand from Lahaul suggested strengthening and convergence of societies like *Lahaul-Spiti Paryavaran Suraksha Samiti, Udaipur* would be a much-needed step. The *Lahaul-Spiti Paryavaran Suraksha Samiti* works with all the departments and other agencies to converge their initiatives for better management of the landscape.
- Dr Abhishek Ghoshal recommended to replicate the convergence mechanism which is being implemented in Spiti. Spiti has landscape level implementation committee with CF/DCF as head and serving officers of government departments, senior officers of District Administration, NGOs, community-based organisations and members from Village Councils/Gram Sabhas as members. They also have village level committees. This could provide good insight for conceiving a good coordination mechanism for integrated approach for conservation and development of the Pangti-Lahaul SL landscape.

Vote of thanks

On behalf of GICIA India Pvt. Ltd., Mr Sudhanshu Arjaria, State Project Officer thanked Dr Savita, PCCF (WL), Dr Srivastav, Addl. PCCF (WL), S/shri Dem Chand and Tog Chand, community representatives, and all the other participants for attending the workshop and providing their useful insights, comments and suggestions on all aspects of the integrated strategy and management of the SL landscape. He especially expressed his gratitude for community members from Lahaul and Pangti, who travelled all the way from landscape area to attend the workshop, and share their views.

Annexure-6:

Proceedings of the Stakeholder Workshop on Participatory Integrated Landscape Level Management Strategy and Plan for districts of Lahaul-Pangi, HP

Date: 21st August 2019

Time: 10:00 A.M to 03:45 P.M

Venue: Library Hall, Killar (Chamba) HP

Agenda of the workshop and list of participants are in Annexure-1 and 2 respectively.

A. Welcome Remarks

Sudhanshu Arjeria, State Project Officer, GIPL/NCCF welcomed all the participants and thanked them for sparing some time from their busy schedule to attend the stakeholder consultation conducted by GIPL/NCCF. After the welcome note, Mr Arjeria took permission from SDM, Pangri to start the proceedings. Mr Arjeria gave the overview of the process of preparing participatory integrated landscape-based strategy and plan, and the role of stakeholder consultation. He informed that in last 6 months the GIPL team travelled in the landscape area and have gathered a lot of information about this landscape. He further added that GIPL team had carried out a number of discussions with different Government officials, organisations, individual experts and local communities from the landscape pertaining to conservation and management of Snow Leopard and its landscape.

Mr Arjeria explained that landscape-based strategy and plan desire an appropriate framework and mechanism to integrate different departments, agencies, NGOs and institutions working in the landscape area. The role of local community in managing the landscape area is crucial since they are the ultimate custodians of the regional biodiversity.

B. Key Discussion

1. Livelihood (Agriculture and Horticulture):

- Discussion started with main agricultural crops of the area. Many participants expressed their concern that due to lack of proper transportation mechanism most of the farmers are not being able to sell their perishable produce like Cauliflower, Green pea at right time.
- Some participants also said that farmers are interested in cultivation and marketing of MAPs but lack a common understanding of market scenario and cultivation methods.
- Bhag Singh, Dy. Pradhan of Chask, told that they have to pay more than Rs.200 per bag due to lack of proper road transportation.
- Most of the participants were unaware of fact that that organic certification of agricultural produce of the landscape has already started. The knowledge of local community pertaining to pros and cons of organic certification was very less.
- Participants also discussed about “**Zero Budget Farming**” Concept promoted by HP Government. Mr. Bhanu Pratap Singh from Agriculture department explained the participants about the working of this scheme but it was observed that level of awareness about this scheme was very low.
- Mr. Bhanu also raised a question about SECURE Himalaya Project. He said as lot of consultations had already been done with local communities what would be the timelines for implementation of the activities planned under the project?
- Mr. Premchand of Gubari shed some light on importance of bees in agriculture and horticulture especially in Apple cultivation. Participants felt that Bee-keeping must be promoted in the landscape.

2. Animal Husbandry:

- Dr. Rana, Director, Department of Animal Husbandry took the lead in this discussion. He discussed about recent news of virus of rabies and FMD (Foot and Mouth Disease). These problems were very rare in the landscape, but in last few year reports related to rabies and FMD have increased many folds. Failure of vaccination is an important reason of this increase. Inadequate cold-chain facilities are the major reason behind overall failure of vaccination programme.
- It was also observed that some *Gaddis* are not using their traditional routes for their seasonal migration. This is also a major concern for the animal husbandry department. Because of this change in route, animal husbandry officials are not being able to vaccinate all the migratory animals.
- During the implementation phase of Government schemes to promote the indigenous breed of the area, it was observed that traditional breeds have become very rare in the landscape

area. Crossbreeding has covered almost all the cows. *Sahiwal* variety has been induced in landscape and result of this introduction will appear in next two or three years.

- Scarcity of fodder is a very big issue in the landscape. Participants discussed about development of fodder banks in every village.
- Participants also suggested the organisation of *livestock melas*, where villagers can sell and buy animals.
- Participants asked about an agreement between SECURE Project and Animal Husbandry department in Lahaul area. Participants wanted to know the result of this agreement although most of the line departments were totally unaware about this agreement.

3. Tourism:

- Participants agreed that landscape has tremendous scope of tourism but till date only one officially recognized home-stay is available in the whole Pangri area. They informed that about 30 applications for Home-stay registration are pending with tourism department in Chamba.
- Participants emphasized that lack of proper training and knowledge about Tourism, Eco-tourism or sustainable tourism is a big concern for this landscape.

4. NTFP (Non-Timber Forest Products):

- NTFP collection is an important source of income for most of the villagers in this landscape. Participants told that people from *Churah*, other places and even from Nepal are involved in illegal collection of valuable NTFPs.
- Most of the NTFP collectors are not aware about sustainable collection of many NTFPs. They are also not fetching proper price for the collected herbs.
- There is a need of providing a Collection centre and primary processing centre of local herbs in the landscape.

5. Biodiversity and BMC (Biodiversity Management Committee):

- Most of the participants were unaware of importance of biodiversity and its role in their life.
- Although BMCs have been constituted in all the *Panchayats*, still people are unaware of its role and importance. Participants discussed about capacity building and strengthening of BMCs. BMC members need primary training about functioning of BMCs and preparation of PBRs.

C. Vote of Thanks:

On behalf of GICIA India Pvt. Ltd., Mr Sudhanshu Arjeria, State Project Officer thanked all the representatives from the line departments, community representatives, and all the other participants for attending the workshop and providing their useful insights, comments and suggestions on all aspects of the integrated strategy and management of the SL landscape. He especially expressed his gratitude for community members from Lahaul and Pangri, who travelled all the way from landscape area to attend the workshop, and share their views.
